# MULTIPLICATIVE STRUCTURES IN MOD $q$ COHOMOLOGY THEORIES II 

Shôrô ARAKI* and Hirosi TODA

(Received March 27, 1966)

This paper is the continuation of part I, Osaka J. Math. 2 (1965), pp. 71-115. $\S \S 1-5$ are contained in Part I and this part consists of $\S \S 6-12$. We use all notations and notions defined in Part I.

In $\S 6$ we discuss admissible multiplications $\mu_{q}$ in $\widetilde{K}\left(; Z_{q}\right)$ and show that they induce multiplications $\mu_{q}^{*}$ in periodic cohomology $\widetilde{K}^{*}\left(; Z_{q}\right)$; Künneth isomorphism $\widetilde{K}^{*}\left(X ; Z_{p}\right) \otimes \widetilde{K}^{*}\left(Y ; Z_{p}\right) \simeq \widetilde{K}^{*}\left(X \wedge Y ; Z_{p}\right)$ holds for any prime $p$; an important property of $\bmod q K$-theory, Propositions 6.3 and 6.4 , is discussed. $\S 7$ is devoted to the discussion of commutativity criteria of admissible multiplications (Corollary 7.7, Theorems 7.11 and 7.13) ; we can establish the existence or non-existence of commutative admissible multiplications in $\tilde{K}\left(; Z_{q}\right)$ for all $q>1$. $\S 8$ is a preparation mainly for $\S 9$. The existence of associative admissible multiplications is proved in $\S 9(q=2)$ and $\S 10(q \neq 2)$. In case $q=2$, it is guaranteed whenever $\eta^{* *}=0$ (which is required even for the existence proof of admissible $\mu_{2}$ of Theorem 5.9) (Theorem 9.9). In case $q \neq 2$, it is proved only under some conditions (Theorems 10.6 and 10.7). These are sufficient to prove the associativity for every admissible multiplication of $\tilde{K}\left(; Z_{q}\right)$ (Corollary 10.8). In $\S 11$ we discuss Bockstein spectral sequences for general cohomologies and multiplicative structures in them. We see many analogous properties as those of ordinary Bockstein spectral sequences. Whenever the existence of admissible $\mu_{p}$ is guaranteed by Theorem 5.9, then some $\mu_{p}$ induces multiplications $m_{r}$ in $E_{r}$-terms of $\bmod p$ Bockstein spectral sequences for each prime $p$. It is noticeable that $d_{r}$ behaves as a derivation to $m_{r}$ (Theorem 11.10) even though the compatibility of the reduction $\rho_{s p, p}$ with $\mu_{s p}$ and $\mu_{p}$ is generally not proved, from which follows Künneth's isomorphism for each term of Bockstein spectral sequences of periodic $K^{*}$-cohomology (Theorem 11.11). $\S 12$ is an appendix treating some further properties of the maps $\bar{a}: M_{q} \rightarrow M_{r}$ of 2.4, not treated there.

[^0]
## 6. Multiplications in $\bmod \boldsymbol{a} K$-cohomology.

6. 7. The Atiyah-Hirzebruch $K$-cohomology theory of complex vector bundles has the commutative and associative multiplication $\mu$ defined by tensor products [2]. Thus its associated multiplications $\mu_{R}$ and $\mu_{L}$ satisfies $\left(H_{1}\right)-\left(H_{8}\right)$. By Theorem 2.3 and Proposition 2.5 any homomorphism $f: Z_{q} \rightarrow Z_{r}$ induces a natural map

$$
f_{*}: \widetilde{K}^{i}\left(; Z_{q}\right) \rightarrow \widetilde{K}^{i}\left(; Z_{r}\right)
$$

for each $i$, and ( $H_{9}$ ) holds.
Since $\tilde{K}^{i}\left(S^{0}\right) \cong Z$ or 0 according as $i$ is even or odd, we easily see that

$$
\begin{equation*}
\tilde{K}^{i}\left(S^{0}\right)=\rho_{q} \widetilde{K}^{i}\left(S^{0} ; Z_{q}\right) \cong Z_{q} \quad \text { or } \quad 0 \tag{6.1}
\end{equation*}
$$

according as $i$ is even or odd. From (6.1), for $i=-2$, Theorems 2.3, 5.9 , Corollaries 3.10 and 3.11 follows

Theorem 6.1. For every integer $q>1$ there exist just $q$ distinct admissible multiplications in $\tilde{K}\left(; Z_{q}\right)$.
6. 2. Let $g$ be the generator of $\tilde{K}^{0}\left(S^{2}\right)$, given by the reduced Hopf bundle. Bott's isomorphism

$$
\beta: \widetilde{K}^{i}(X) \approx \tilde{K}^{i-2}(X)
$$

is given by the formula $\beta=\sigma^{-2} \mu(\otimes g)$. Making use of $\mu_{R}$, we define Bott's isomorphism

$$
\begin{equation*}
\beta_{q}: \widetilde{K}^{i}\left(X ; Z_{q}\right) \cong \widetilde{K}^{i-2}\left(X ; Z_{q}\right) \tag{6.2}
\end{equation*}
$$

in $\tilde{K}\left(; Z_{q}\right)$ for each $i$ by

$$
\beta_{q}=\sigma_{q}^{-2} \mu_{R}(\otimes g)
$$

in the same way as $\beta$, which is natural. $\quad \beta_{q}=\beta$ as a map : $\widetilde{K}^{i+2}\left(X \wedge M_{q}\right) \rightarrow$ $\tilde{K}^{i}\left(X \wedge M_{q}\right)$, hence (6.2) is an isomorphism.

By $\left(H_{4}\right)-\left(H_{7}\right)$ and $\left(H_{9}\right)$ we have the commutativities:

$$
\begin{align*}
\sigma_{q} \beta_{q} & =\beta_{q} \sigma_{q}, & & \beta_{q} \rho_{q}=\rho_{q} \beta \\
\delta \beta_{q} & =\beta \delta, & & \delta_{q} \beta_{q}=\beta_{q} \delta_{q}  \tag{6.3}\\
f_{*} \beta_{q} & =\beta_{r} f_{*} & &
\end{align*}
$$

for any homomorphism $f: Z_{q} \rightarrow Z_{r}$.
$\beta_{q}$ gives isomorphisms of exact sequences of $\bmod q \tilde{K}$-cohomology associated with cofibrations. Consequently we can define periodic $Z_{2}$ graded $\bmod q \widetilde{K}^{*}$-cohomology theory by putting

$$
\tilde{K}^{*}\left(X ; Z_{q}\right)=\tilde{K}^{0}\left(X ; Z_{q}\right) \oplus \tilde{K}^{1}\left(X ; Z_{q}\right)
$$

and identifying $\widetilde{K}^{2 i}\left(X ; Z_{q}\right)$ with $\widetilde{K}^{0}\left(X ; Z_{q}\right)$ and $\tilde{K}^{2 i+1}\left(X ; Z_{q}\right)$ with $\widetilde{K}^{1}\left(X ; Z_{q}\right)$ via $\beta_{q}^{i}$. By (6.3) natural maps $\sigma_{q}, \rho_{q}, \delta, \delta_{q}$ and $f_{*}$ are introduced also in the periodic theory $\tilde{K}^{*}\left(; Z_{q}\right)$.

Let $\mu_{q}$ be an admissible multiplication in $\tilde{K}\left(; Z_{q}\right)$. By $\left(H_{8}\right),\left(\Lambda_{1}\right)$, and $\left(\Lambda_{3}\right)$ we obtain the equalities

$$
\begin{equation*}
\mu_{q}\left(\beta_{q} \otimes 1\right)=\mu_{q}\left(1 \otimes \beta_{q}\right)=\beta_{q} \mu_{q} \tag{6.4}
\end{equation*}
$$

which imply that
(6.5) $\mu_{q}$ induces a multiplication, denoted by $\mu_{q}^{*}$, in the periodic cohomology $\tilde{K}^{*}\left(; Z_{q}\right)$ satisfying also the admissibility conditions $\left(\Lambda_{1}\right)-\left(\Lambda_{3}\right)$.

By a general argument using an induction on cells and (6.1) we get a Künneth isomorphism :

Theorem 6. 2. If $\tilde{K}^{*}\left(X ; Z_{q}\right)$ or $\tilde{K}^{*}\left(Y ; Z_{q}\right)$ is a $Z_{q}$-free module, then $\mu_{9}^{*}$ induces an isomorphism

$$
\widetilde{K}^{*}\left(X ; Z_{q}\right) \otimes \tilde{K}\left(Y ; Z_{q}\right) \cong \widetilde{K}^{*}\left(X \wedge Y ; Z_{q}\right)
$$

6. 3. The following proposition is important for our later discussions.

Proposition 6. 3. Let $\bar{\eta}$ be a generator of $\left\{S^{2} M_{2}, S^{2}\right\}$ given in (4.1). There holds the relation

$$
\bar{\eta}^{* *}=\sigma^{2} \beta \pi_{2}^{* *}
$$

for $\widetilde{K}$-theory.
Proof. Let $\bar{\eta}$ be represented by a map $f: S^{4} M_{2} \rightarrow S^{4}$ such that $f\left(S^{4} i\right)=S^{2} \eta, \eta$ is the Hopf map. Then the mapping cone of $f$ is

$$
L=S^{4} \cup_{f} C S^{4} M_{2}=S^{4} \cup e^{6} \cup e^{7}=S^{2} P \cup_{h} e^{7}
$$

where $h: S^{6} \rightarrow S^{2} P$ is the attaching map of $e^{7}$ and $P$ is the complex projective plane. From the cell structure of $L$ we see easily that

$$
H^{i}(L ; Z) \cong \begin{cases}Z & \text { for } i=0,4 \\ Z_{2} & \text { for } i=7 \\ 0 & \text { others }\end{cases}
$$

and $S q^{3} \mid H^{4}(L ; Z)$ is non-trivial. Thus, by discussing the Atiyah-Hirzebruch spectral sequence with $E_{2}^{*}=H^{*}(L ; Z)$ and $E_{\infty}^{*}=G K^{*}(L ; Z)$ [2], we see that

$$
\tilde{K}^{1}(L) \cong 0 \quad \text { and } \quad \tilde{K}^{0}(L) \cong Z
$$

Then, from the exact sequence

$$
\tilde{K}^{0}\left(S^{4}\right) \xrightarrow{\bar{\eta}^{*}} \tilde{K}^{0}\left(S^{4} M_{2}\right) \longrightarrow \tilde{K}^{1}(L)
$$

associated with the cofibration $S^{4} \rightarrow L \rightarrow S^{4} M_{2}$, it follows that the above $\bar{\eta}^{*}$ and, via Bott isomorphism, the homomorphism $\bar{\eta}^{*}: \tilde{K}^{0}\left(S^{2}\right) \rightarrow \tilde{K}^{0}\left(S^{2} M_{2}\right)$ are epimorphic. $\pi^{*}: \tilde{K}^{0}\left(S^{2}\right) \rightarrow \tilde{K}^{0}\left(M_{2}\right)$ is also epimorphic. Thus $\bar{\eta}^{*}$ and $\pi^{*}$ are both equal to the projection: $Z \rightarrow Z_{2}$. Hence

$$
\bar{\eta}^{*}=\sigma^{2} \beta \pi^{*}
$$

as maps: $\tilde{K}^{0}\left(S^{2}\right) \rightarrow \tilde{K}^{0}\left(S^{2} M_{2}\right)$.
For any $W$ and any $x \in \widetilde{K}^{i}\left(W \wedge S^{2}\right)$, there exists $x^{\prime} \in \widetilde{K}^{i}(W)$ such that $\mu\left(x^{\prime} \otimes g\right)=x$ by the Bott isomorphism theorem. Then we have

$$
\begin{align*}
\bar{\eta}^{* *} x & =\left(1_{W} \wedge \bar{\eta}\right)^{*} \mu\left(x^{\prime} \otimes g\right)=\mu\left(x^{\prime} \otimes \bar{\eta}^{*} g\right) \\
& =\mu\left(x^{\prime} \otimes \mu\left(\pi^{*} g \otimes g\right)\right)=\mu\left(\left(1_{W} \wedge \pi^{*}\right) \mu\left(x^{\prime} \otimes g\right) \otimes g\right) \\
& =\mu\left(\pi^{* *} x \otimes g\right)=\sigma^{2} \beta \pi^{* *} x
\end{align*}
$$

6. 4. The above proposition can be generalized to the following

Proposition 6.4. Let $q$ be even. For any class $\bar{\eta} \in\left\{S^{2} M_{q}, S^{2}\right\}$ of (4.1) the following relation

$$
\bar{\eta}^{* *}=(q / 2) \cdot \sigma^{2} \beta \pi_{q}^{* *}
$$

holds for $\tilde{K}$-theory.
Proof. Denote by $\bar{\eta}_{2} \in\left\{S^{2} M_{2}, S^{2}\right\}$ an element $\bar{\eta}$ for $q=2$. Let $\gamma \in$ $\left\{S^{2} M_{q}, S^{2} M_{2}\right\}$ be the class of $S^{2}(\overline{q / 2})$, where $\overline{q / 2}: M_{q} \rightarrow M_{2}$ is a map of (2.5), i.e.,

$$
\gamma\left(S^{2} i_{q}\right)=S^{2} i_{2} \quad \text { and } \quad\left(S^{2} \pi_{2}\right) \gamma=(q / 2) \cdot S^{2} \pi_{q} .
$$

We have

$$
\bar{\eta}\left(S^{2} i_{q}\right)=\eta=\bar{\eta}_{2}\left(S^{2} i_{2}\right)=\bar{\eta}_{2} \gamma\left(S^{2} i_{q}\right) .
$$

Then, from the exact sequence

$$
\left\{S^{4}, S^{2}\right\} \xrightarrow{S^{2} \pi_{a}^{*}}\left\{S^{2} M_{q}, S^{2}\right\} \xrightarrow{S^{2} i_{q}^{*}}\left\{S^{3}, S^{2}\right\}
$$

follows the relation

$$
\bar{\eta} \equiv \bar{\eta}_{2} \gamma \bmod \eta^{2}\left(S^{2} \pi_{q}\right)
$$

Since $\eta^{* *}=0$ in $\tilde{K}$, we have

$$
\begin{align*}
\bar{\eta}^{* *} & =\gamma^{* *} \bar{\eta}_{2}^{* *}=\gamma^{* *} \sigma^{2} \beta \pi_{2}^{* *} \\
& =\sigma^{2} \beta \gamma^{* *} \pi_{2}^{* *}=(q / 2) \cdot \sigma^{2} \beta \pi_{q}^{* *} .
\end{align*}
$$

## 7. (Non-) Commutativity of $\bmod \boldsymbol{q}$ multiplications.

7.1. In this section we use the following convention: for each $x \in \widetilde{h}^{i}\left(X ; Z_{q}\right)$, which is the same as $\widetilde{h}^{i+2}\left(X \wedge M_{q}\right)$ by definition, we denote $x$ as $\bar{x}$ when we consider it as an element of $\widetilde{h}^{i+2}\left(X \wedge M_{q}\right)$.

Let $\mu$ be a commutative and associative multiplication in a cohomology theory $\tilde{h}$ and $\mu_{q}$ an admissible multiplication in $\widehat{h}\left(; Z_{q}\right)$ constructed in $\S 5$ (assuming that $\eta^{* *}=0$ in case $q \equiv 2(\bmod 4)$ and fixing an element $\bar{\alpha}$ of (4.17)). That is, for $x \in \widetilde{h}^{i}\left(X ; Z_{q}\right), y \in \widetilde{h}^{j}\left(Y ; Z_{q}\right)$ and $w=\mu_{q}(x \otimes y)$, we have

$$
\begin{equation*}
\bar{w}=\sigma^{-2} \gamma_{W}\left(1_{W} \wedge \alpha\right)^{*}\left(1_{X} \wedge T^{\prime} \wedge 1_{M}\right)^{*} \mu(\bar{x} \otimes \bar{y}), \tag{7.1}
\end{equation*}
$$

where $W=X \wedge Y$ and $T^{\prime}=T\left(Y, M_{q}\right)$.
Put

$$
w^{\prime}=\mu_{q}^{\prime}(x \otimes y)=(-1)^{i j} T^{\prime \prime *} \mu_{q}(y \otimes x)
$$

for $T^{\prime \prime}=T(X, Y)$. $\mu_{q}^{\prime}$ is also an admissible multiplication. In fact, by a routine calculation making use of the commutativity of $\mu$ and the naturality of $\gamma$ etc., we see that

$$
\begin{equation*}
\bar{w}^{\prime}=\sigma^{-2} \gamma_{W}\left(1_{W} \wedge(T \alpha)\right)^{*}\left(1_{X} \wedge T^{\prime} \wedge 1_{M}\right)^{*} \mu(\bar{x} \otimes \bar{y}) \tag{7.2}
\end{equation*}
$$

where $T=T\left(M_{q}, M_{q}\right)$.
Computing the difference $\bar{w}^{\prime}-\bar{w}$ for $x=y=\kappa_{1}$ we discuss the (non-) commutativity of $\mu_{q}$. To do this, we may choose $\kappa_{1}$ suitably.

Lemma 7.1. We can choose $\kappa_{1} \in \tilde{h}^{1}\left(M_{q} ; Z_{q}\right)$ satisfying (3.7) as

$$
\begin{equation*}
\bar{\kappa}_{1}=\beta_{0}^{*}\left(\sigma^{3} 1\right) \tag{7.3}
\end{equation*}
$$

Proof. Discussing the integral cohomology map $\beta_{0}^{*}$ by using (4.9') we see that

$$
\begin{equation*}
\beta_{0}\left(1_{M} \wedge i\right)=\pi \wedge 1_{S} \quad \text { and } \quad \beta_{0}\left(i \wedge 1_{M}\right)=-1_{S} \wedge \pi \tag{7.3'}
\end{equation*}
$$

where $S=S^{1}$, which show (3.7) immediately for the element $\kappa_{1}$ defined by (7.3). q.e.d.

In this section we define $\kappa_{1}$ always by (7.3).
Lemma 7.2. Let $q$ be even. There holds the relation

$$
\mathbf{1}_{M} \wedge \eta=\eta_{1}+\eta_{2}
$$

in $\left\{S^{2} M_{q}, S M_{q}\right\}$ after choosing $\eta_{3}$ suitably in case $q \equiv 0(\bmod 4)$.
Proof. By Theorem 4.1 we may put

$$
1_{M} \wedge \eta=x \cdot \eta_{1}+y \cdot \eta_{2}+z \cdot(S i) \eta^{2}\left(S^{2} \pi\right)
$$

for $x, y$, and $z \in Z_{2}$, where $z=0$ in case $q \equiv 2(\bmod 4)$. Composing $S \pi$ on both sides from the left we see that

$$
\eta\left(S^{2} \pi\right)=\pi \wedge \eta=(S \pi)\left(1_{M} \wedge \eta\right)=y \cdot \eta\left(S^{2} \pi\right) .
$$

Thus $y=1$. Similarly, composing $S^{2} i$ from the right, we obtain that $x=1$. In case $q \equiv 0(\bmod 4)$, replacing $\eta_{3}$ by $\eta_{3}+\eta_{1}^{2}$ if necessary, we see that $\eta_{3}$, hence $\eta_{1}$ and $\eta_{2}$, can be chosen so that $z=0$.
7.2. First we discuss the case $q=2$. Put

$$
\begin{equation*}
\eta^{\prime}=(1 \wedge i) \eta_{1}(1 \wedge \pi) \quad \text { and } \quad \eta^{\prime \prime}=(1 \wedge i) \eta_{2}(1 \wedge \pi), \tag{7.4}
\end{equation*}
$$

which belong to $\left\{M_{2} \wedge M_{2}, M_{2} \wedge M_{2}\right\}$. By (4.3),

$$
\eta^{\prime}=(i \wedge i) \bar{\eta}(1 \wedge \pi) \quad \text { and } \quad \eta^{\prime \prime}=(1 \wedge i) \widetilde{\eta}(\pi \wedge \pi) .
$$

Proposition 7. 3. (i) $\left\{M_{2} \wedge M_{2}, S M_{2}\right\} \cong Z_{2}+Z_{2}+Z_{2}$ with generators $\eta_{1}(1 \wedge \pi), \eta_{2}(1 \wedge \pi)$ and $(S i) \eta \beta_{0}$.
(ii) $\left\{M_{2} \wedge M_{2}, M_{2} \wedge M_{2}\right\} \cong Z_{4}+Z_{4}+Z_{2}$ with generators $1_{M \wedge M}, \alpha_{0} \beta_{0}$ and $\eta^{\prime}$.
(iii) There hold the relations

$$
\eta^{\prime}\left(\alpha_{0} \beta_{0}\right)=2 \cdot \alpha_{0} \beta_{0} \quad \text { and } \quad\left(\alpha_{0} \beta_{0}\right)\left(\alpha_{0} \beta_{0}\right)=\left(\alpha_{0} \beta_{0}\right) \eta^{\prime}=\eta^{\prime} \eta^{\prime}=0 .
$$

Proof. (i) In the exact sequence of (1.7):
$0 \rightarrow\left\{S^{2} M_{2}, S M_{2}\right\} \xrightarrow{(1 \wedge \pi)^{*}}\left\{M_{2} \wedge M_{2}, S M_{2}\right\} \xrightarrow{(1 \wedge i)^{*}} \operatorname{Tor}\left(\left\{S M_{2}, S M_{2}\right\}, Z_{2}\right) \rightarrow 0$,
$(1 \wedge i)^{*}\left((S i) \eta \beta_{0}\right)$ generates $\operatorname{Tor}\left(\left\{S M_{2}, S M_{2}\right\} ; Z_{2}\right)$ since $(1 \wedge i)^{*}\left((S i) \eta \beta_{0}\right)=$ (Si) $\eta(S \pi)=2 \cdot 1_{S M}$. And $2 \cdot(S i) \eta \beta_{0}=0$. Thus the above sequence splits and (i) follows from Theorem 4.1.
(ii) In the exact sequence
$0 \rightarrow\left\{M_{2} \wedge M_{2}, S M_{2}\right\} \xrightarrow{(1 \wedge i)_{*}}\left\{M_{2} \wedge M_{2}, M_{2} \wedge M_{2}\right\} \xrightarrow{(1 \wedge \pi)_{*}}\left\{M_{2} \wedge M_{2}, S^{2} M_{2}\right\} \rightarrow 0$,
((1.7'), the above (i) and (4.10)), $\left\{M_{2} \wedge M_{2}, S^{2} M_{2}\right\}$ is generated by $1 \wedge \pi$ $=(1 \wedge \pi)_{*} 1_{M \wedge M}$ and $\left(S^{2} i\right) \beta_{0}=(1 \wedge \pi)_{*} \alpha_{0} \beta_{0}$ by (4.10) and (4.9'). Here

$$
\begin{aligned}
2 \cdot 1_{M \wedge M} & =1_{M} \wedge\left(2 \cdot 1_{M}\right)=1_{M} \wedge(i \eta \pi) \\
& =(1 \wedge i)\left(\eta_{1}+\eta_{2}\right)(1 \wedge \pi) \quad \text { by Lemma } 7.2 \\
& =\eta^{\prime}+\eta^{\prime \prime} \neq 0
\end{aligned}
$$

by (i) and the above exact sequence, and

$$
\begin{aligned}
2 \cdot \alpha_{0} \beta_{0} & =(i \wedge i) \eta \beta_{0} & \text { by (4.15') } \\
& =(1 \wedge i)_{*}(S i) \eta \beta_{0} \neq 0 &
\end{aligned}
$$

by (i) and the above exact sequence. Thus (ii) follows.
(iii) $\beta_{0} \alpha_{0}=p \bar{\beta} \bar{\alpha} \bar{i}_{1}=p \bar{i}_{1}=0$ by (4.9) and (4.7). Thus $\left(\alpha_{0} \beta_{0}\right)\left(\alpha_{0} \beta_{0}\right)=0$. $\beta_{0}(i \wedge i)=(S \pi)(S i)=0$ by (4.9'). Thus $\left(\alpha_{0} \beta_{0}\right) \eta^{\prime}=0 . \quad(\pi \wedge \pi) \alpha_{0}=\left(S^{2} \pi\right)\left(S^{2} i\right)=0$ by $\left(4.9^{\prime}\right)$, hence $\eta^{\prime \prime}\left(\alpha_{0} \beta_{0}\right)=0 ; 2 \cdot \alpha_{0} \beta_{0}=\left(2 \cdot 1_{M^{\wedge} M_{M}}\right) \alpha_{0} \beta_{0}=\left(\eta^{\prime}+\eta^{\prime \prime}\right) \alpha_{0} \beta_{0}=\eta^{\prime}\left(\alpha_{0} \beta_{0}\right)$. $\eta^{\prime} \eta^{\prime}=(1 \wedge i) \bar{\eta}(1 \wedge \pi)(1 \wedge i) \bar{\eta}(1 \wedge \pi)=0$. Hence (iii) is proved.

Theorem 7.4. For $T=T\left(M_{2}, M_{2}\right)$ there holds the relation

$$
T \equiv 1_{M \wedge M}+\alpha_{0} \beta_{0}+\eta^{\prime} \quad \bmod 2 \cdot\left\{M_{2} \wedge M_{2}, M_{2} \wedge M_{2}\right\}
$$

Proof. Set

$$
T=x \cdot 1_{M \wedge M}+y \cdot \alpha_{0} \beta_{0}+z \cdot \eta^{\prime}, \quad x, y \in Z_{4} \text { and } z \in Z_{2},
$$

by Proposition 7.3, (ii). By (4.9') and (4.11) we have

$$
(1 \wedge \pi)+\left(S^{2} i\right) \beta_{0}=(1 \wedge \pi) T=x \cdot(1 \wedge \pi)+y \cdot\left(S^{2} i\right) \beta_{0}
$$

Thus
(*)

$$
x \equiv y \equiv 1(\bmod 2)
$$

by (4.10). Next, if $z=0$,

$$
1_{M \wedge M}=T^{2}=x^{2} \cdot 1_{M \wedge M}+(2 x y) \cdot \alpha_{0} \beta_{0}
$$

by the above setting and Proposition 7.3, (iii), which implies that $x y \equiv 0$ (mod 2) contradicting to (*), i.e.,

$$
z=1
$$

q.e.d.

Corollary 7.5. $T \alpha \equiv \alpha+\eta^{\prime} \alpha \bmod 2 \cdot\left\{N_{2}, M_{2} \wedge M_{2}\right\}$.
Because : $\beta_{0} \alpha=p \bar{\beta} \bar{\alpha} j=p j=0$ by (4. 7).
7.3. New we compute $\bar{w}^{\prime}-\bar{w}$ of (7.1)-(7.2) for $x=y=\kappa_{1}$ in case $q=2$. Since $2 \cdot \mu\left(\bar{\kappa}_{1} \otimes \bar{\kappa}_{1}\right)=0$ by Proposition 3.2,

$$
\begin{aligned}
& \bar{w}^{\prime}-\bar{w}= \sigma^{-2} \gamma_{W}\left(1_{W} \wedge \eta^{\prime} \alpha\right)^{*}\left(1_{M} \wedge T^{\prime} \wedge 1_{M}\right)^{*} \mu\left(\bar{\kappa}_{1} \otimes \bar{\kappa}_{1}\right) \\
& \text { by Corollary } 7.5 \text { for } W=M_{2} \wedge M_{2} \\
&= \sigma^{-2} \gamma_{W} \alpha^{* *}\left(1_{M} \wedge \pi\right)^{* *} \bar{\eta}^{* *}\left(1_{M} \wedge T_{1} \wedge 1_{S}\right)^{*}(1 \wedge i \wedge 1 \wedge i)^{*} \mu\left(\bar{\kappa}_{1} \otimes \bar{\kappa}_{1}\right) \\
& \quad \text { for } T_{1}=T\left(M_{2}, S^{1}\right) \text { and } S=S^{1} \\
&= \sigma^{-2} \gamma_{W} \pi_{0}^{* *} \bar{\eta}^{* *}\left(1_{M} \wedge T_{1} \wedge 1_{S}\right)^{*} \mu\left((S \pi)^{*} \sigma^{3} 1 \otimes(S \pi)^{*} \sigma^{3} 1\right) \\
& \text { by }(7.3),\left(7.3^{\prime}\right),\left(4.9^{\prime}\right),\left(4.18^{\prime}\right) \\
&= \sigma^{-2} \bar{\eta}^{* *}\left(\pi \wedge \pi \wedge 1_{S^{2}}\right)^{*} \mu\left(\mu\left(\sigma^{2} 1 \otimes \sigma^{2} 1\right) \otimes \sigma^{2} 1\right) \\
& \quad \text { by Lemma } 5.2,(i) \text { and } T\left(S^{2}, S^{1}\right) \simeq 1 \\
&= \mu\left(\mu\left(\pi^{*} \sigma^{2} 1 \otimes \pi^{*} \sigma^{2} 1\right) \otimes \bar{\eta}^{*} 1\right) .
\end{aligned}
$$

Thus, putting

$$
\begin{aligned}
\bar{a} & =\bar{\eta}^{*} 1, \quad a \in \widetilde{h}^{-2}\left(S^{0} ; Z_{2}\right), \\
w^{\prime}-w & =\mu_{L}\left(\mu\left(\pi^{*} \sigma^{2} 1 \otimes \pi^{*} \sigma^{2} 1\right) \otimes a\right) \\
& =\mu_{2}\left(\rho_{2} \mu\left(\pi^{*} \sigma^{2} 1 \otimes \pi^{*} \sigma^{2} 1\right) \otimes a\right) \\
& =\mu_{2}\left(a \otimes \mu_{2}\left(\kappa_{2} \otimes \kappa_{2}\right)\right),
\end{aligned}
$$

from which we deduce the following
Theorem 7.6. Let $\tilde{h}$ be equipped with a commutative and associative multiplication $\mu$ and $\eta^{* *}=0$ in $\tilde{h}$. For any admissible multiplication $\mu_{2}$ in $\tilde{h}\left(; Z_{2}\right)$, putting

$$
a=a\left(\mu_{2}\right),
$$

there holds the relation

$$
\bar{a}=\bar{\eta}^{*} 1
$$

Proof. The above formula and (3.13) imply that the theorem is true for a suitably constructed $\mu_{2}$. Since $2 \cdot b\left(\mu_{2}, \mu_{2}^{\prime}\right)=0$ for any two admissible multiplications $\mu_{2}$ and $\mu_{2}^{\prime}$ by Proposition 3.2, (3.18) implies that the theorem is true for any admissible $\mu_{2}$. q.e.d.

Since $\bar{\eta}^{*} 1=0$ if and only if $\bar{\eta}^{* *}=0$ in $\widetilde{h}$, we have
Corollary 7.7. Under the assumption of Theorem 7.6, the necessary and sufficient condition for the existence of commutative admissible $\mu_{2}$ in $\widehat{h}\left(; Z_{2}\right)$ is that $\bar{\eta}^{* *}=0$. When this condition is satisfied, every admissible $\mu_{2}$ is commutative.

Because of Proposition 6.3 and $\pi_{2}^{* *} \neq 0$ in $\tilde{K}$, we have
Corollary 7.8. $\tilde{K}\left(; Z_{2}\right)$ has no commutative admissible $\mu_{2}$. If we denote the two distinct admissible multiplications in $\widetilde{K}\left(; Z_{2}\right)$ by $\wedge$ and $\wedge^{\prime}$, respectively, then

$$
T^{*}(y \wedge x)=x \wedge^{\prime} y=x \wedge y+\beta_{2}\left(\delta_{2} x \wedge \delta_{2} y\right)
$$

for $x \in \tilde{K}^{*}\left(X ; Z_{2}\right), y \in \tilde{K}^{*}\left(Y ; Z_{2}\right)$ and $T=T(X, Y)$.
This corollary means that the admissible multiplication in $\widetilde{K}\left(; Z_{2}\right)$ is essentially unique.
7. 4. Next we discuss the case $q \neq 2(\bmod 4)$.
$N_{q}=S^{2} \vee S^{2} M_{q}$ and $\bar{N}_{q}=S M_{q} \vee S^{2} M_{q}$ by (4.6), (i). Let

$$
i^{\prime}: S^{2} M_{q} \rightarrow N_{q}, \quad \bar{i}^{\prime}: S^{2} M_{q} \rightarrow \bar{N}_{q}
$$

and

$$
\pi^{\prime}: N_{q} \rightarrow S^{2}, \quad \bar{\pi}^{\prime}: \bar{N}_{q} \rightarrow S M_{q}
$$

be the inclusions and the maps collapsing $S^{2} M_{q}$, respectively. Besides (5.2) we have the relations

$$
\begin{align*}
& \bar{i}^{\prime}=j i^{\prime}, \quad \bar{\pi}^{\prime} j=(S i) \pi^{\prime}, \quad \bar{\pi}^{\prime} \bar{i}^{\prime}=0, \\
& p=(S \pi) \bar{\pi}^{\prime}, \quad i_{1}=i^{\prime}\left(S^{2} i\right) \quad \text { and } \quad \bar{\pi}^{\prime} \bar{i}_{1}=0 \tag{7.5}
\end{align*}
$$

In the present case we choose $\gamma_{0}$ as

$$
\gamma_{0}=\pi^{\prime *} \sigma^{2} 1
$$

Then $\gamma_{W}$ satisfies (5.4').
Put

$$
\begin{equation*}
i^{\prime \prime}=\bar{\alpha} \bar{i}^{\prime}: S^{2} M_{q} \rightarrow M_{q} \wedge M_{q}, \quad \pi^{\prime \prime}=\bar{\pi}^{\prime} \bar{\beta}: M_{q} \wedge M_{q} \rightarrow S M_{q}, \tag{7.6}
\end{equation*}
$$

then we obtain the relations

$$
\begin{equation*}
\pi^{\prime \prime} i^{\prime \prime}=0, \quad \pi^{\prime \prime}\left(1_{M} \wedge i\right)=1_{S M} \quad \text { and } \quad\left(1_{M} \wedge \pi\right) i^{\prime \prime}=1_{S^{2} M} \tag{7.7}
\end{equation*}
$$

by Lemmas 4.3, (ii), (4.7), (5.2) and (7.5).
By (4.6), (i), we see immediately
Proposition 7.9. In case $q \neq 2(\bmod 4),\left(1_{M} \wedge i\right)_{*}, i_{*}^{\prime \prime},\left(1_{M} \wedge \pi\right)^{*}$ and $\pi^{\prime \prime *}$ are monomorphic, and we have the following direct sum decompositions
(i) $\left\{W, M_{q} \wedge M_{q}\right\}=(1 \wedge i)_{*}\left\{W, S M_{q}\right\} \oplus i_{*}^{\prime \prime}\left\{W, S^{2} M_{q}\right\}$,
(ii) $\left\{M_{q} \wedge M_{q}, W\right\}=(1 \wedge \pi)^{*}\left\{S^{2} M_{q}, W\right\} \oplus \pi^{\prime \prime}\left\{\left\{S M_{q}, W\right\}\right.$
for any $W$, and in particular
(iii) $\left\{M_{q} \wedge M_{q}, M_{q} \wedge M_{q}\right\}=(1 \wedge i)_{*} \pi^{\prime \prime *}\left\{S M_{q}, S M_{q}\right\} \oplus i_{*}^{\prime \prime} \pi^{\prime \prime *}\left\{S M_{q}, S^{2} M_{q}\right\}$ $\oplus(1 \wedge i)_{*}(1 \wedge \pi)^{*}\left\{S^{2} M_{q}, S M_{q}\right\} \oplus i_{*}^{\prime \prime}(1 \wedge \pi)^{*}\left\{S^{2} M_{q}, S^{2} M_{q}\right\}$.

By Proposition 7.9, (iii), we can put

$$
1_{M \wedge M}=(1 \wedge i) a_{1} \pi^{\prime \prime}+i^{\prime \prime} a_{2} \pi^{\prime \prime}+(1 \wedge i) a_{3}(1 \wedge \pi)+i^{\prime \prime} a_{4}(1 \wedge \pi)
$$

with $a_{1} \in\left\{S M_{q}, S M_{q}\right\}, a_{2} \in\left\{S M_{q}, S^{2} M_{q}\right\}, a_{3} \in\left\{S^{2} M_{q}, S M_{q}\right\}$ and $a_{4} \in\left\{S^{2} M_{q}\right.$, $\left.S^{2} M_{q}\right\}$. Compose $1 \wedge \pi$ on both sides from the left, then by (7.7) we get

$$
1 \wedge \pi=a_{2} \pi^{\prime \prime}+a_{4}(1 \wedge \pi)
$$

hence

$$
a_{2}=0 \quad a_{4}=1_{S^{2} M}
$$

by Proposition 7.9, (ii), for $W=S^{2} M_{q}$. Similarly, composing $\pi^{\prime \prime}$ from the left, we get

$$
a_{1}=1_{S M} \quad \text { and } \quad a_{3}=0
$$

Thus we obtain

$$
\begin{equation*}
1_{M \wedge M}=i^{\prime \prime}(1 \wedge \pi)+(1 \wedge i) \pi^{\prime \prime} \tag{7.8}
\end{equation*}
$$

Next, put

$$
T=(1 \wedge i) b_{1} \pi^{\prime \prime}+i^{\prime \prime} b_{2} \pi^{\prime \prime}+(1 \wedge i) b_{3}(1 \wedge \pi)+i^{\prime \prime} b_{4}(1 \wedge \pi)
$$

with $b_{1} \in\left\{S M_{q}, S M_{q}\right\}, b_{2} \in\left\{S M_{q}, S^{2} M_{q}\right\}, b_{3} \in\left\{S^{2} M_{q}, S M_{q}\right\}$ and $b_{4} \in\left\{S^{2} M_{q}\right.$, $\left.S^{2} M_{q}\right\}$ for $T=T\left(M_{q}, M_{q}\right)$. Compose $1 \wedge \pi$ on both sides from the left. By (4.11), (i) and (7.7) we get

$$
\left(1_{M} \wedge \pi\right)+\left(S^{2} i\right) \beta_{0}=b_{2} \pi^{\prime \prime}+b_{4}(1 \wedge \pi) .
$$

Here

$$
\left(S^{2} i\right) \beta_{0}=\left(S^{2} i\right) p \bar{\beta}=\left(S^{2} i\right)(S \pi) \pi^{\prime \prime}
$$

by (4.9), (7.5) and (7.6). Thus, by Proposition 7.9, (ii), for $W=S^{2} M_{q}$ we get

$$
b_{2}=\left(S^{2} i\right)(S \pi) \quad \text { and } \quad b_{4}=1_{S^{2} M}
$$

Similarly, composing $1 \wedge i$ from the right and making use of (4.11), (ii), with a remark that

$$
\alpha_{0}(S \pi)=\bar{\alpha} \bar{i}_{1}(S \pi)=i^{\prime \prime}\left(S^{2} i\right)(S \pi),
$$

Proposition 7. 9, (i), for $W=S M_{q}$, implies that

$$
b_{1}=-1_{S_{M}} .
$$

Therefore we see that

$$
T=-(1 \wedge i) \pi^{\prime \prime}+i^{\prime \prime}\left(S^{2} i\right)(S \pi) \pi^{\prime \prime}+i^{\prime \prime}(1 \wedge \pi)+(1 \wedge i) \xi(1 \wedge \pi)
$$

with $\xi \in\left\{S^{2} M_{q}, S M_{q}\right\}$, from which follows

$$
T^{2}=(1 \wedge i) \pi^{\prime \prime}+i^{\prime \prime}(1 \wedge \pi)+i^{\prime \prime}\left(S^{2} i\right)(S \pi) \xi(1 \wedge \pi)+(1 \wedge i) \xi\left(S^{2} i\right)(S \pi) \pi^{\prime \prime}
$$

Since $T^{2}=1_{M \wedge M}$, by (7.8) and Proposition 7.9, (ii), we obtain

$$
\left(S^{2} i\right)(S \pi) \xi=0 \quad \text { and } \quad \xi\left(S^{2} i\right)(S \pi)=0
$$

These relations, Theorem 4.1 and Corollary 4.2, (i), imply

$$
\xi= \begin{cases}0 & \text { if } q \text { is odd } \\ \varepsilon_{q} \cdot(S i) \eta^{2}\left(S^{2} \pi\right) & \text { if } q \equiv 0(\bmod 4)\end{cases}
$$

with $\varepsilon_{q} \in Z_{2}$. Thus we obtain
Theorem 7.10. In case $q \equiv 2(\bmod 4)$ there holds the relation

$$
T=-(1 \wedge i) \pi^{\prime \prime}+i^{\prime \prime}\left(S^{2} i\right)(S \pi) \pi^{\prime \prime}+i^{\prime \prime}(1 \wedge \pi)+\varepsilon_{q} \cdot(i \wedge i) \eta^{2}(\pi \wedge \pi)
$$

for $T=T\left(M_{q}, M_{q}\right)$, where $\varepsilon_{q} \in Z_{2}$ in case $q \equiv 0(\bmod 4)$ and $\varepsilon_{q}=0$ in case $q$ odd.
7.5. Now we compute $\bar{w}^{\prime}-\bar{w}$ of (7.1)-(7.2) for $x=y=\kappa_{1}$ in case $q \equiv 2(\bmod 4)$. By our choice of $\gamma_{0}, \gamma_{W}=\left(1_{W} \wedge i^{\prime}\right)^{*}$ by (5.4'). Thus

$$
\begin{equation*}
\gamma_{W}\left(1_{W} \wedge \alpha\right)^{*}\left(1_{W} \wedge(1 \wedge i) \pi^{\prime \prime}\right)^{*}=0 \tag{7.9}
\end{equation*}
$$

since $(1 \wedge i) \pi^{\prime \prime} \alpha i^{\prime}=(1 \wedge i) \bar{\pi}^{\prime} \bar{i}^{\prime}=0$ by (7.5), (7.6) and (4.18). Also

$$
\begin{equation*}
i^{\prime \prime}\left(S^{2} i\right)(S \pi) \pi^{\prime \prime} \alpha=0 \tag{7.10}
\end{equation*}
$$

because of (7.5), (7.6) and (4.18). Making use of (7.8)-(7.10) and Theorem 7.10, a parallel computation to the case of $q=2$ implies

$$
\bar{w}^{\prime}-\bar{w}=\mu\left(\mu\left(\pi^{*} \sigma^{2} 1 \otimes \pi^{*} \sigma^{2} 1\right) \otimes \varepsilon_{q} \cdot \pi^{*} \eta^{2} 1\right) .
$$

Thus, putting $\bar{a}=\pi^{*} \eta^{2 *} 1, a \in \widetilde{h}^{-2}\left(S^{0} ; Z_{q}\right)$, we have

$$
w^{\prime}-w=\mu_{q}\left(\varepsilon_{q} \cdot a \otimes \mu_{q}\left(\kappa_{2} \otimes \kappa_{2}\right)\right),
$$

from which by (3.13) we conclude

$$
\begin{equation*}
a\left(\mu_{q}\right)=\varepsilon_{q} \cdot a, \quad \bar{a}=\pi^{*} \eta^{2 *} 1 \tag{7.11}
\end{equation*}
$$

Therefore,
Theorem 7.11. Let $\mu$ be a commutative and associative multiplication in $\tilde{h}$. By a suitable construction of $\S 5$ in case $q \neq 2(\bmod 4)$ we can obtain a commutative admissible multiplication $\mu_{q}$ if $q$ is odd or if $q \equiv 0(\bmod 4)$ and $\left(\eta^{2} \pi\right)^{* *}=0$.

This theorem for $q$ odd asserts a slightly different thing from Corollary 3.11 , i.e., the unique commutative admissible $\mu_{q}$ can be constructed by the manner of $\S 5$, which is necessary for the proof of the existence of a commutative and associative admissible $\mu_{q}$ later in $\S 10$.

In case $q \equiv 0(\bmod 4)$ it is an open question whether we can choose $\alpha$ such that $\varepsilon_{q}=0$ or not. If we can do so, then the existence of a commutative admissible $\mu_{q}$ without any condition follows.

In case $\widetilde{K}$-cohomology, $\left(\eta^{2} \pi\right)^{* *}=\pi^{* *} \eta^{* *} \eta^{* *}=0$. Thus
Corollary 7.12. If $q \equiv 0(\bmod 4)$ there exist just two distinct commutative admissible multiplications $\mu_{q}$ in $\tilde{K}\left(; Z_{q}\right)$.
7. 6. In case $q \equiv 2(\bmod 4)$, from Theorems $7.6,7.11$ and 3.14 follows

Theorem 7.13. Let $\hat{h}$ be equipped with a commutative and associative multiplication $\mu$ and $\eta^{* *}=0$ in $\widetilde{h}$. If $q \equiv 2(\bmod 4)$, a necessary and sufficient condition for the existence of a commutative admissible multiplication in $\widetilde{h}\left(; Z_{q}\right)$ is that $\bar{\eta}^{* *}=0$ in $\widehat{h}$ for $\bar{\eta} \in\left\{S^{2} M_{2}, S^{2}\right\}$.

Corollary 7.14. If $q \equiv 2(\bmod 4)$, there exist no commutative admissible multiplications in $\widetilde{K}\left(; Z_{q}\right)$.

## 8. Stable homotopy of some elementary complexes. II.

8.1. Let $P$ be the complex projective plane, i.e., $P=S^{2} U_{\eta} e^{4}$. Let $i_{P}: S^{2} \rightarrow P$ and $\pi_{P}: P \rightarrow S^{4}$ be the inclusion and the map collapsing $S^{2}$. We have a cofibration

$$
\begin{equation*}
S^{2} \xrightarrow{i_{P}} P \xrightarrow{\pi_{P}} S^{4} . \tag{8.1}
\end{equation*}
$$

From Puppe's exact sequence and its dual, (1.5) and (1.5'), associated with (8.1) for $X$ and $Y$ spheres, we obtain
(8.2) the groups $\left\{S^{n+k+3}, S^{n} P\right\}$ and $\left\{S^{n} P, S^{n-k+3}\right\}, k \leqq 3$, are both isomorphic to the corresponding groups in the following table:

| generators of | $k \leqq-2$ | $k=-1$ | $k=0$ | $k=1$ | $k=2$ | $k=3$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | $Z$ | 0 | $Z$ | $Z_{12}$ | 0 |
| $\left\{S^{n+k+3}, S^{n} P\right\}$ |  | $i_{P}$ |  | $\tilde{\zeta}$ | $i_{P} \nu$ |  |
| $\left\{S^{n} P, S^{n-k+3}\right\}$ |  | $\pi_{P}$ |  | $\bar{\zeta}$ | $\nu \pi_{P}$ |  |

where $\tilde{\zeta}$ and $\bar{\zeta}$ are defined by

$$
\begin{equation*}
\pi_{P} \tilde{\zeta}=2 \cdot 1_{n+4} \quad \text { and } \quad \bar{\zeta} i_{P}=2 \cdot 1_{n+2}, 1_{m} \in\left\{S^{m}, S^{m}\right\} \tag{8.3}
\end{equation*}
$$

Theorem 8.1. The groups $\left\{P, S^{i} P\right\}, 0 \leq i \leq 2$, and $\{S P, P\}$ are isomorphic to the corresponding groups in the following table:

|  | generators |  |
| :---: | :---: | :---: |
| $\left\{P, S^{2} P\right\}$ | $Z$ | $\left(S^{2} i_{P}\right) \pi_{P}$ |
| $\{P, S P\}$ | 0 |  |
| $\{P, P\}$ | $Z \oplus Z$ | $1_{P}, \tilde{\zeta} \pi_{P}\left(\right.$ or $\left.i_{P} \bar{\zeta}\right)$ |
| $\{S P, P\}$ | $Z_{6}$ | $i_{P} \nu\left(S \pi_{P}\right)$ |

We have relations

$$
\begin{equation*}
i_{P} \bar{\zeta}+\widetilde{\zeta} \pi_{P}=2 \cdot 1_{P} \tag{8.4}
\end{equation*}
$$

and

$$
\begin{equation*}
1_{P} \wedge \eta=3 \cdot i_{P} \nu\left(S \pi_{P}\right) \tag{8.5}
\end{equation*}
$$

for $\eta \in\left\{S^{1}, S^{0}\right\}$.
Proof. From (8.2), (1.5) and (1.5') suitably used, we see easily the results for $\left\{P, S^{i} P\right\}, 0 \leq i \leq 2$. Then, by (8.3), we obtain the relation (8.4).

Now we observe an exact sequence (1.5) associated with (8.1):

$$
\begin{equation*}
\left\{S^{4}, P\right\} \xrightarrow{\eta^{*}}\left\{S^{5}, P\right\} \xrightarrow{\left(S \pi_{P}\right)^{*}}\{S P, P\} \xrightarrow{\left(S i_{P}\right)^{*}}\left\{S^{3}, P\right\} . \tag{*1}
\end{equation*}
$$

(8.2) and the fact that every element of $\eta^{*}$-images is at most of order 2 show that

$$
\begin{equation*}
\{S P, P\} \cong Z_{6} \text { or } Z_{12} \text { with the generator } i_{P} \nu\left(S \pi_{P}\right) \tag{*2}
\end{equation*}
$$

And we can put

$$
\begin{equation*}
1_{P} \wedge \eta=a \cdot\left(S i_{P}\right) \nu\left(S^{2} \pi_{P}\right) \in\left\{S^{2} P, S P\right\} \tag{*3}
\end{equation*}
$$

for some integer $a, \eta \in\left\{S^{2}, S^{1}\right\}$ and $\nu \in\left\{S^{6}, S^{3}\right\}$.
By Theorem 1.1 and (*3),

$$
2 \cdot 1_{P \wedge M}=1_{P} \wedge\left(2 \cdot 1_{M}\right)=a \cdot\left(i_{P} \wedge i_{2}\right) \nu\left(\pi_{P} \wedge \pi_{2}\right), \quad M=M_{1}
$$

If $a$ were even, then $2 \cdot 1_{P \wedge M}=0$ since $i_{2}$ is of order 2 ; then

$$
\begin{aligned}
P \wedge M_{2} \wedge M_{2} & =S\left(P \wedge M_{2}\right) \cup_{2 \cdot 1}^{P \wedge I K} \\
& \simeq S\left(P \wedge M_{2}\right) \\
& \simeq S\left(P \wedge M_{2}\right) \vee S^{2}\left(P \wedge M_{2}\right)
\end{aligned}
$$

in the stable range, which is but a contradiction because $S q^{4} \neq 0$ in $P \wedge M_{2} \wedge M_{2}$ whereas $=0$ in $S\left(P \wedge M_{2}\right) \vee S^{2}\left(P \wedge M_{2}\right)$. Hence

$$
\begin{equation*}
a \text { is odd. } \tag{*4}
\end{equation*}
$$

Next, by (8.1), (8.2), (*1), and (*3),

$$
\begin{aligned}
0 & =\left(S \pi_{P}\right)^{*} \eta * \tilde{\zeta}=\left(S \pi_{P}\right) *(\tilde{\zeta} \wedge \eta)=\left(1_{P} \tilde{\xi} \pi_{P}\right) \wedge \eta \\
& =\left(1_{P} \wedge \eta\right) \tilde{\zeta} \pi_{P}=2 a \cdot i_{P} \nu \pi_{P},
\end{aligned}
$$

which implies via (*2) that

$$
a=3 \quad \text { and } \quad\{S P, P\} \cong Z_{6} . \quad \text { q.e.d. }
$$

8.2. From now on through this section $M, i$, and $\pi$ stand for $M_{2}$, $i_{2}$, and $\pi_{2}$. We shall compute the groups $\left\{M_{2} \wedge P, S^{i} M_{2}\right\}$ for $2 \leq i \leq 4$. We have

$$
M_{2} \wedge P=M_{2} \wedge\left(S^{2} \cup_{\eta} C S^{3}\right)=S^{2} M_{2} \cup_{1 \wedge \eta} C S^{3} M_{2}, \quad 1=1_{M} .
$$

From its associated exact sequence (1.5) for $X=S^{i} M_{2}$ :

$$
\begin{aligned}
& \left\{S^{3} M, S^{i} M\right\} \xrightarrow{(1 \wedge \eta)^{*}}\left\{S^{4} M, S^{i} M\right\} \xrightarrow{\left(1 \wedge \pi_{P}\right)^{*}}\left\{M \wedge P, S^{i} M\right\} \\
& \xrightarrow{\left(1 \wedge i_{P}\right)^{*}}\left\{S^{2} M, S^{i} M\right\} \xrightarrow{(1 \wedge \eta)^{*}}\left\{S^{3} M, S^{i} M\right\},
\end{aligned}
$$

follows the exact sequence

$$
\begin{equation*}
0 \rightarrow \operatorname{Coker}(1 \wedge \eta)_{t-1}^{*} \xrightarrow{\left(1 \wedge \pi_{P^{2}}\right.}{ }^{*}\left\{M \wedge P, S^{i} M\right\} \xrightarrow{\left(1 \wedge i_{P}\right)^{*}} \operatorname{Ker}(1 \wedge \eta)_{*}^{*} \rightarrow 0, \tag{8.6}
\end{equation*}
$$

where $(1 \wedge \eta)_{i}^{*}$ stands for $\left(1_{M} \wedge \eta\right)^{*}:\left\{S^{n+2} M, S^{n+i} M\right\} \rightarrow\left\{S^{n+3} M, S^{n+i} M\right\}, n=0$ or 1. Marking use of the relations in Corollary 4.2, (ii), and the relation of Lemma 7.2 we have

$$
\left(1_{M} \wedge \eta\right)^{*}(i \pi)=2 \cdot 1_{M}, \quad\left(1_{M} \wedge \eta\right)^{*} 1_{M}=\eta_{1}+\eta_{2}
$$

and

$$
\left(1_{M} \wedge \eta\right) * \eta_{i}=\eta_{i}{ }^{2}, \quad i=1,2 .
$$

Then, from Theorem 4.1. follow
(i) $\operatorname{Ker}(1 \wedge \eta)_{3}^{*}=\operatorname{Ker}(1 \wedge \eta)_{3}^{*}=0$,
(ii) $\operatorname{Ker}(1 \wedge \eta)_{2}^{*} \cong Z_{2}$ generated by $2 \cdot 1_{M}$,
(iii) $\operatorname{Coker}(1 \wedge \eta)_{3}^{*} \cong Z_{2}$ generated by the class of $1_{M}$,
(iv) $\operatorname{Coker}(1 \wedge \eta)_{2}^{*} \cong Z_{2}$ generated by the class of $\eta_{1}$ (or $\eta_{2}$ ),
(v) $\operatorname{Coker}(1 \wedge \eta)_{1}^{*} \cong Z_{2}$ generated by the class of $i \nu \pi$.

Theorem 8. 2. (i) $\left\{M_{2} \wedge P, S^{4} M_{2}\right\} \cong Z_{2}$ generated by $1_{M} \wedge \pi_{P}$.
(ii) $\left\{M_{2} \wedge P, S^{3} M_{2}\right\} \cong Z_{2}$ generated by $\eta_{1}\left(1_{M} \wedge \pi_{P}\right)=\eta_{2}\left(1_{M} \wedge \pi_{P}\right)$.
(iii) $\left\{M_{2} \wedge P, S^{2} M_{2}\right\} \cong Z_{2} \oplus Z_{2}$ generated by $\left(S^{2} i\right) \nu\left(\pi \wedge \pi_{P}\right)$ and $1_{M} \wedge \xi$, where $\nu \in\left\{S^{6}, S^{3}\right\}$ and $\xi \in\left\{P, S^{2}\right\}$.
(iv) We have the relation $\eta_{1}^{2}\left(1_{M} \wedge \pi_{P}\right)=\eta_{2}^{2}\left(1_{M} \wedge \pi_{P}\right)=0$.

Proof. (i) and (ii) follow from (8.6) and (8.7). (iii) follows from (8.3), (8.6), (8.7), and the following:

$$
\begin{array}{rlr}
2 \cdot 1_{M} \wedge \xi & =(i \eta \pi) \wedge \xi=\left(S^{2} i\right)(\eta \wedge \bar{\xi})\left(\pi \wedge 1_{P}\right), \quad \eta \in\left\{S^{2}, S^{1}\right\}, \\
& =\left(S^{2} i\right)\left(1_{S} \wedge \xi\right)\left(\eta \wedge 1_{P}\right)\left(\pi \wedge 1_{P}\right) \\
& =3 \cdot\left(S^{2} i\right)\left(1_{S} \wedge \bar{\xi}\right)\left(1_{S} \wedge i_{P}\right) \nu\left(\pi \wedge \pi_{P}\right) \quad \text { by }(8.5) \\
& =6 \cdot\left(S^{2} i\right) \nu\left(\pi \wedge \pi_{P}\right) \in 2 \cdot\left(1 \wedge \pi_{P}\right)^{*}\left\{S^{4} M, S^{2} M\right\}=0 .
\end{array}
$$

(iv) follows from

$$
\left(1_{M} \wedge \eta\right)^{*} \eta_{i}=\eta_{i}^{2}, \quad i=1,2 .
$$

Next we compute the group $\left\{M_{2} \wedge P, M_{2} \wedge P\right\}$.
Theorem 8. 3. $\left\{M_{2} \wedge P, M_{2} \wedge P\right\}=Z_{4} \oplus Z_{2}$ generated by $1_{M \wedge P}$ and $1_{M} \wedge i_{P} \xi$. We have a relation

$$
2 \cdot 1_{M \wedge P}=\left(i \wedge i_{P}\right) \nu\left(\pi \wedge \pi_{P}\right)=1_{M} \wedge i_{P} \bar{\xi}+1_{M} \wedge \tilde{\xi} \pi_{P} \neq 0 .
$$

Proof. Let us consider an exact sequence (1.5'):

$$
\begin{aligned}
&\left\{M \wedge P, S^{3} M\right\} \\
& \xrightarrow{(1 \wedge \eta)^{*}}\left\{M \wedge P, S^{2} M\right\} \xrightarrow{\left(1 \wedge i_{P}\right)_{*}}\{M \wedge P, M \wedge P\} \\
& \xrightarrow{\left(1 \wedge \pi_{P}\right)^{*}}\left\{M \wedge P, S^{4} M\right\} .
\end{aligned}
$$

$\left(1 \wedge \pi_{P}\right)_{*}$ is epimorphic since $\left(1 \wedge \pi_{P}\right)_{*} 1_{M \wedge P}=1 \wedge \pi_{P}$ generates $\left\{M \wedge P, S^{4} M\right\}$ (Theorem 8.2, (i)). $\left(1 \wedge i_{P}\right)_{*}$ is monomorphic since $\left\{M \wedge P, S^{3} M\right\}$ is generated by $\eta_{1}\left(1 \wedge \pi_{P}\right)$ and $(1 \wedge \eta)_{*} \eta_{1}\left(1 \wedge \pi_{P}\right)=\eta_{1}^{2}\left(1 \wedge \pi_{P}\right)=0$ (Theorem 8.2, (ii) and (iv)). The image group $\left(1 \wedge i_{P}\right)_{*}\left\{M \wedge P, S^{2} M\right\} \cong Z_{2} \oplus Z_{2}$ is generated by $1_{M} \wedge i_{P} \xi$ and ( $\left.i \wedge i_{P}\right) \nu\left(\pi \wedge \pi_{P}\right.$ ) (Theorem 8.2, (iii)). Finally, by Theorem 8.1,

$$
2 \cdot 1_{M \wedge P}=3 \cdot\left(i \wedge i_{P}\right) \nu\left(\pi \wedge \pi_{P}\right)=\left(i \wedge i_{P}\right) \nu\left(\pi \wedge \pi_{P}\right)
$$

since it is of order 2 at most. Thus the theorem is proved.
8. 3. We shall discuss some structures of $M_{2} \wedge N_{2}$ and $M_{2} \wedge M_{2} \wedge M_{2}$. Let $\pi_{1}: N_{2} \rightarrow P$ be the map collapsing $S^{3}$ such that

$$
\begin{equation*}
\pi_{1} i_{0}=i_{P} \quad \text { and } \quad \pi_{P} \pi_{1}=\left(S^{2} \pi\right) \pi_{0} \tag{8.8}
\end{equation*}
$$

stably. We have a cofibration

$$
\begin{equation*}
S^{3} \xrightarrow{i_{1}} N_{2} \xrightarrow{\pi_{1}} P . \tag{8.8'}
\end{equation*}
$$

Proposition 8.4. There exists a stable homotopy equivalence

$$
\varepsilon \in\left\{S^{3} M_{2} \vee\left(M_{2} \wedge P\right), M_{2} \wedge N_{2}\right\}
$$

such that $\left(1_{M} \wedge \pi_{1}\right) \varepsilon$ is stably homotopic to the projection of $S^{3} M_{2} \vee\left(M_{2} \wedge P\right)$ onto $M_{2} \wedge P$.

Proof. By (4.6), (ii), there exists a homotopy equivalence $S N_{2} \simeq$ $S^{4} \cup_{2 \cdot \pi_{P}} C P$ such that $S \pi_{1}$ is equivalent to the map $S^{4} \cup_{2 \cdot \pi_{P}} C P \rightarrow S P$ collapsing $S^{4}$ to a point. Denoting $N_{2}$ by $N$,

$$
S(M \wedge N)=M \wedge S N \simeq M \wedge\left(S^{4} \cup_{2 \cdot \pi_{P}} C P\right)=S^{4} M \cup_{1_{M} \wedge 2 \cdot \pi_{P}} C(M \wedge P)
$$

By Theorem 8. 2, (i), $1_{M} \wedge 2 \cdot \pi_{P}=2 \cdot\left(1_{M} \wedge \pi_{P}\right) \in 2 \cdot\left\{M \wedge P, S^{4} M\right\}=0$. Thus, by a general argument (cf., the beginning part of the proof of Lemma 4.3) we can conclude the proposition.

Proposition 8.5. Choosing an element $\bar{\alpha}$ of Lemma 4.3, we have a stable homotopy equivalence

$$
\widetilde{\alpha} \in\left\{S^{3} M_{2} \vee\left(M_{2} \wedge P\right) \vee S^{3} M_{2}, M_{2} \wedge M_{2} \wedge M_{2}\right\}
$$

such that

$$
\left(1_{M} \wedge \alpha\right) \varepsilon=\tilde{\alpha} k
$$

where $\varepsilon$ is the stable map of Proposition 8.4 and $k: S^{3} M_{2} \vee\left(M_{2} \wedge P\right) \rightarrow$ $S^{3} M_{2} \vee\left(M_{2} \wedge P\right) \vee S^{3} M_{2}$ the inclusion to the first two factors.

Proof. For $1_{M} \wedge 2 \cdot i_{0} \in\left\{S^{2} M, M \wedge N\right\}$ we have

$$
\begin{aligned}
1_{M} \wedge 2 \cdot i_{0} & =2 \cdot 1_{M} \wedge i_{0}=(i \eta \pi) \wedge i_{0}=(i \pi) \wedge \eta \wedge i_{0} \\
& =(i \pi) \wedge 2 \cdot i_{1}=(2 \cdot i \pi) \wedge i_{1}=0
\end{aligned}
$$

Thus

$$
M \wedge \bar{N}=M \wedge\left(N \cup_{2 \cdot i_{0}} C S^{2}\right)=(M \wedge N) \cup_{1_{M} \wedge 2 \cdot i_{0}} C S^{2} M
$$

is stably homotopy equivalent to $(M \wedge N) \vee S^{3} M$ preserving the subspace $M \wedge N$, i.e., we have a stable homotopy equivalence $\varepsilon_{1} \in\{M \wedge \bar{N},(M \wedge N)$ $\left.\vee S^{3} M\right\}$ such that $\varepsilon_{1}\left(1_{M} \wedge j\right)=k_{0}$, the inclusion map: $M \wedge N \rightarrow(M \wedge N) \vee S^{3} M$. Put

$$
\widetilde{\alpha}=\left(1_{M} \wedge \bar{\alpha}\right) \varepsilon_{1}^{-1}\left(\varepsilon \vee 1_{S^{3} M}\right),
$$

which is a stable homotopy equivalence. And

$$
\begin{array}{rlr}
\widetilde{\alpha} k & =\left(1_{M} \wedge \bar{\alpha}\right) \varepsilon_{1}^{-1} k_{0} \varepsilon=\left(1_{M} \wedge \bar{\alpha}\right)\left(1_{M} \wedge j\right) \varepsilon \quad \text { by Proposition } 8.4 \\
& =\left(1_{M} \wedge \alpha\right) \varepsilon . & \text { q.e.d. }
\end{array}
$$

By Theorems 8.2, 8.3, Propositions 8.4 and 8.5 we have
Theorem 8.6. (i ) $\left\{M_{2} \wedge P, M_{2} \wedge N_{2}\right\} \cong Z_{4} \oplus Z_{2} \oplus Z_{2}$.
(ii) $\quad\left\{M_{2} \wedge P, M_{2} \wedge M_{2} \wedge M_{2}\right\} \cong Z_{4} \oplus Z_{2} \oplus Z_{2} \oplus Z_{2}$.
8.4. The following two lemmas will be used in the next section.

Lemma 8.7. We can choose an element $p_{0} \in\left\{M_{2} \wedge P, S^{2} N_{2}\right\}$ satisfying the relations:

$$
\begin{equation*}
\left(S^{2} \pi_{0}\right) p_{0}=1_{M} \wedge \pi_{P}, p_{0}\left(1_{M} \wedge i_{P}\right)=S^{2}\left(i_{0} \pi\right) \tag{8.9}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(S^{2} \pi_{1}\right) p_{0}=\left(1_{P} \wedge \pi\right) T \quad \text { for } T=T\left(M_{2}, P\right) \tag{8.10}
\end{equation*}
$$

Proof. Consider the complex $M \wedge P / S^{1} \wedge S^{2}$. It has the same cell structure as $S^{2} N$, hence we have a homotopy equivalence $M \wedge P / S^{1} \wedge S^{2}$ $\simeq S^{2} N$. The map collapsing $S^{1} \wedge S^{2}$ followed by the homotopy equivalence gives rise to a map $p_{0}^{\prime}: M \wedge P \rightarrow S^{2} N$ such that

$$
S^{3}=S^{1} \wedge S^{2} \xrightarrow{i \wedge i_{P}} M \wedge P \xrightarrow{p_{0}^{\prime}} S^{2} N
$$

is a cofibration. The candidates for $p_{0}$ are $p_{0}^{\prime}$ and $p_{0}^{\prime}+p_{0}^{\prime}\left(1_{M} \wedge \tilde{\xi} \pi_{P}\right)$, $\tilde{\zeta} \in\left\{S^{4}, P\right\}$. First we see easily that both candidates satisfy (8.9) because both sides of the equalities induce the same mod 2 homology maps, and $\left\{M \wedge P, S^{4} M\right\} \cong Z_{2}$ and $\left\{S^{2} M, S^{2} N\right\} \cong Z_{2}$ as is easily seen.

Discussing an exact sequence (1.5) for the cofibration $S^{1} \wedge P \xrightarrow{i \wedge 1_{P}}$ $M \wedge P \xrightarrow{\pi \wedge 1_{P}} S^{2} \wedge P$ and $X=S^{2} P$ by making use of Theorem 8.1, we see that
$\left\{M \wedge P, S^{2} P\right\} \cong Z_{2} \oplus Z_{2}$ generated by $\left(1_{P} \wedge \pi\right) T$ and $\left(S^{2} \tilde{\zeta}\right)\left(\pi_{P} \wedge \pi\right) T$.
Thus

$$
\left(S^{2} \pi_{1}\right) p_{0}^{\prime}=\left(1_{P} \wedge \pi\right) T
$$

or

$$
\left(S^{2} \pi_{1}\right) p_{0}^{\prime}=\left(1_{P} \wedge \pi\right) T+\left(S^{2} \tilde{\zeta}\right)\left(\pi_{P} \wedge \pi\right) T
$$

since $\left(S^{2} \pi_{1}\right) p_{0}^{\prime}$ induce a non-zero $\bmod 2$ homology map. If (\#1) holds, then putting $p=p_{0}^{\prime}$ we finish the proof. If ( $\# 2$ ) holds, then put

$$
p_{0}=p_{0}^{\prime}+p_{0}^{\prime}\left(1_{M} \wedge \tilde{\zeta}_{P}\right)
$$

Since

$$
\begin{aligned}
\left(1_{P} \wedge \pi\right) T\left(1_{M} \wedge \widetilde{\zeta}_{\pi_{P}}\right) & =\left(1_{P} \wedge \pi\right)\left(\widetilde{\zeta}_{\pi_{P}} \wedge 1_{M}\right) T \\
& =\left(S^{2} \tilde{\zeta}\right)\left(\pi_{P} \wedge \pi\right) T
\end{aligned}
$$

and

$$
\begin{aligned}
\left(\pi_{P} \wedge \pi\right) T\left(1_{M} \wedge \widetilde{\zeta}_{r_{P}}\right) & =\left(\pi_{P} \wedge \pi\right)\left(\tilde{\zeta}_{P} \wedge 1_{M}\right) T \\
& =2 \cdot\left(\pi_{P} \wedge \pi\right) T=0,
\end{aligned}
$$

we see that

$$
\begin{align*}
\left(S^{2} \pi_{1}\right) p_{0} & =\left(S^{2} \pi_{1}\right) p_{0}^{\prime}+\left(S^{2} \pi_{1}\right) p_{0}^{\prime}\left(1_{M} \wedge \tilde{\zeta}_{\pi_{P}}\right) \\
& =\left(1_{P} \wedge \pi\right) T+\left(S^{2} \tilde{\zeta}\right)\left(\pi_{P} \wedge \pi\right) T \\
& +\left(1_{P} \wedge \pi\right) T\left(1_{M} \wedge \tilde{\zeta} \pi_{P}\right)+\left(S^{2} \tilde{\zeta}\right)\left(\pi_{P} \wedge \pi\right) T\left(1_{M} \wedge \tilde{\zeta} \pi_{P}\right) \\
& =\left(1_{P} \wedge \pi\right) T
\end{align*}
$$

Lemma 8.8. For any $\alpha \in\left\{N_{2}, M_{2} \wedge M_{2}\right\}$ satisfying $\left(1_{M} \wedge \pi\right) \alpha=\pi_{0}$ there exists an element $\kappa=\kappa_{\omega} \in\left\{M_{2} \wedge P, M_{2} \wedge N_{2}\right\}$ such that

$$
\begin{equation*}
\left(1_{M} \wedge \pi_{1}\right) \kappa=1_{M \wedge P} \quad \text { and } \quad\left(1_{M} \wedge \pi_{0}\right) \kappa=\left(S^{2} \alpha\right) p_{0} \tag{8.11}
\end{equation*}
$$

Proof. Consider the following commutative diagram of exact rows :

The group $\left\{M \wedge P, M \wedge S^{2} M\right\}$ has 4 elements because of Theorem 8.2,
(i) and (ii), and (1.7'). By Theorems 8.2, (iii), and 8.6, (i), the groups $\left\{M \wedge P, S^{2} M\right\}$ and $\{M \wedge P, M \wedge N\}$ have 4 and 16 elements, respectively. Hence $\left(1 \wedge \pi_{0}\right)_{*}$ is epimorphic and there exists an element $\kappa^{\prime} \in\{M \wedge P$, $M \wedge N\}$ such that

$$
\left(1 \wedge \pi_{0}\right)_{*} \kappa^{\prime}=\left(S^{2} \alpha\right) p_{0}
$$

Now

$$
\begin{aligned}
\left(1 \wedge \pi_{P}\right)_{*} 1_{M \wedge P} & =1 \wedge \pi_{P}=\left(S^{2} \pi_{0}\right) p_{0} & & \text { by (8.9) } \\
& =\left(1 \wedge S^{2} \pi\right)\left(S^{2} \alpha\right) p_{0} & & \text { by assumption } \\
& =\left(1 \wedge S^{2} \pi\right)_{*}\left(1 \wedge \pi_{0}\right)_{*} \kappa^{\prime} & & \\
& =\left(1 \wedge \pi_{P}\right)_{*}\left(1 \wedge \pi_{1}\right)_{*} \kappa^{\prime} & & \text { by (8.8). }
\end{aligned}
$$

Thus

$$
1_{M \wedge P}-\left(1 \wedge \pi_{1}\right)_{*} \kappa^{\prime}=\left(1 \wedge i_{P}\right)_{*} x
$$

for some element $x \in\left\{M \wedge P, S^{2} M\right\}$. Put

$$
\kappa=\kappa^{\prime}+\left(1 \wedge i_{0}\right)_{*} x ;
$$

then

$$
\begin{aligned}
\left(1 \wedge \pi_{1}\right) \kappa & =\left(1 \wedge \pi_{1}\right)_{*} \kappa^{\prime}+\left(1 \wedge \pi_{1}\right)_{*}\left(1 \wedge i_{0}\right)_{*} x \\
& =\left(1 \wedge \pi_{1}\right)_{*} \kappa^{\prime}+\left(1 \wedge i_{P}\right)_{*} x \\
& =1_{M \wedge P}
\end{aligned}
$$

and

$$
\begin{align*}
\left(1 \wedge \pi_{0}\right) \kappa & =\left(1 \wedge \pi_{0}\right)_{*} \kappa^{\prime}+\left(1 \wedge \pi_{0}\right)_{*}\left(1 \wedge i_{0}\right)_{*} x \\
& =\left(S^{2} \alpha\right) p_{0} .
\end{align*}
$$

## 9. Associativity of $\bmod 2$ multiplications.

9.1. Let $\mu$ be a commutative and associative multiplication in $\tilde{h}$, and assume that $\eta^{* *}=0$ in $\widetilde{h}$. Under this assumption the exact sequence of $\hat{h}$ associated to the cofibration $S^{2} \xrightarrow{i_{P}} P \xrightarrow{\pi_{P}} S^{4}$ of coefficients breaks into the following short exact sequences

$$
\begin{equation*}
0 \rightarrow \tilde{h}^{k}\left(W \wedge S^{4}\right) \xrightarrow{\left(1 \wedge \pi_{P}\right)^{*}} \tilde{h}^{k}(W \wedge P) \xrightarrow{\left(1 \wedge i_{P}\right)^{*}} \tilde{h}^{k}\left(W \wedge S^{2}\right) \rightarrow 0 \tag{9.1}
\end{equation*}
$$

for any $W$ and $k$. In particular, for $W=S^{0}$ and $k=2$, we can choose an element $\gamma_{1} \in \widetilde{h}^{2}(P)$ such that

$$
\begin{equation*}
i_{P}^{*} \gamma_{1}=\sigma^{2} 1 \tag{9.2}
\end{equation*}
$$

Put

$$
\begin{equation*}
\gamma_{0}=\pi_{1}^{*} \gamma_{1} \tag{9.3}
\end{equation*}
$$

Then, because of (8.8), $\gamma_{0}$ defined by (9.3) satisfies (5.3). Hence any multipilcation $\mu_{2}$ constructed in $\S 5$ by making use of the above $\gamma_{0}$ is admissible. We discuss the associativity of such a $\mu_{2}$.

Choosing an element $\gamma_{1}$ satisfying (9.2), we define a homomorphism

$$
\tilde{\gamma}=\tilde{\gamma}_{W}: \tilde{h}^{k}(W \wedge P) \rightarrow \widetilde{h}^{k}\left(W \wedge S^{4}\right)
$$

for any $W$ by

$$
\begin{equation*}
\tilde{\gamma}_{W}(x)=\left(1_{W} \wedge \pi_{P}\right)^{*-1}\left(x-\mu\left(\sigma^{-2}\left(1_{W} \wedge i_{P}\right)^{*} x \otimes \gamma_{1}\right)\right) \tag{9.4}
\end{equation*}
$$

$x \in \hat{h}^{k}(W \wedge P)$. Since

$$
\begin{aligned}
\left(1_{W} \wedge i_{P}\right)^{*} \mu\left(\sigma^{-2}\left(1_{W} \wedge i_{P}\right)^{*} x \otimes \gamma_{1}\right) & =\mu\left(\sigma^{-2}\left(1_{W} \wedge i_{P}\right)^{*} x \otimes \sigma^{2} 1\right) \\
& =\left(1_{W} \wedge i_{P}\right)^{*} x
\end{aligned}
$$

$x-\mu\left(\sigma^{-2}\left(1_{W} \wedge i_{P}\right)^{*} x \otimes \gamma_{1}\right)$ is in the kernel of $\left(1_{W} \wedge i_{P}\right)^{*}$. By (9.1) $\left(1_{W} \wedge \pi_{P}\right)^{*}$ is monomorphic. Thus $\tilde{\gamma}$ is a well-define homomorphism.

Similarly as in Lemma 5.2, (i) and (ii), we see
Lemma 9.1. (i) $\tilde{\gamma}_{W}$ is a left inverse of $\left(1_{W} \wedge \pi_{P}\right)^{*}$.
(ii) $\tilde{\gamma}$ is natural in the sense that

$$
\left(S^{4} f\right)^{*} \tilde{\gamma}_{W}=\tilde{\gamma}_{W^{\prime}}\left(f \wedge 1_{P}\right)^{*}
$$

for $f: W^{\prime} \rightarrow W$.
9.2. The following lemmas are crucial in later discussions. We define $\gamma_{W}$ by using $\pi_{1}^{*} \gamma_{1}$ as $\gamma_{0}$.

Lemma 9. 2. For the element $p_{0} \in\left\{M_{2} \wedge P, S^{2} N_{2}\right\}$ of Lemma 8.7 there holds the relation

$$
\tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge p_{0}\right)^{*}=\sigma^{2} \gamma_{W} \sigma^{-2}
$$

Proof. For any $x \in \widehat{h}^{k}\left(W \wedge N \wedge S^{2}\right)$ we have

$$
\begin{aligned}
& \left(1_{\left.W \wedge M \wedge \pi_{P}\right)}\right)^{2} \sigma^{2} \gamma_{W} \sigma^{-2} x \\
& \quad=\left(1_{W \wedge M \wedge} \wedge \pi_{P}\right)^{*}\left(1_{W} \wedge S^{2} \pi_{0}\right)^{*-1}\left(x-\sigma^{2} \mu\left(\sigma^{-2}\left(1_{W} \wedge i_{0}\right)^{*} \sigma^{-2} x \otimes \gamma_{0}\right)\right) \\
& =\left(1_{W} \wedge p_{0}\right)^{*} x-\left(1_{W} \wedge p_{0}\right)^{*} \sigma^{2} \mu\left(\sigma^{-2}\left(1_{W} \wedge i_{0}\right)^{*} \sigma^{-2} x \otimes \pi_{1}^{*} \gamma_{1}\right) \\
& \quad \text { by (8.9) and (9. 3) } \\
& =\left(1_{W} \wedge p_{0}\right)^{*} x-\left(1_{W} \wedge\left(T_{1}\left(S^{2} \pi_{1}\right) p_{0}\right)\right)^{*} \mu\left(\left(1_{W} \wedge i_{0}\right)^{*} \sigma^{-2} x \otimes \gamma_{1}\right) \\
& =\left(1_{W} \wedge p_{0}\right)^{*} x-\left(1_{W} \wedge \pi \wedge 1_{P}\right)^{*} \mu\left(\left(1_{W} \wedge i_{0}\right)^{*} \sigma^{-2} x \otimes \gamma_{1}\right) \quad \text { by (8. 10) } \\
& =\left(1_{W} \wedge p_{0}\right)^{*} x-\mu\left(\sigma^{-2}\left(1_{W} \wedge S^{2}\left(i_{0} \pi\right)\right)^{*} x \otimes \gamma_{1}\right) \\
& =\left(1_{W} \wedge p_{0}\right)^{*} x-\mu\left(\sigma^{-2}\left(1_{W \wedge M} \wedge i_{P}\right)^{*}\left(1_{W} \wedge p_{0}\right)^{*} x \otimes \gamma_{1}\right) \quad \text { by (8.9) } \\
& =\left(1_{W \wedge M} \wedge \pi_{P}\right)^{*} \tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge p_{0}\right)^{*} x
\end{aligned} \quad \text { by (9.4). }
$$

Since $\left(1_{W \wedge M} \wedge \pi_{P}\right)$ is monomorphic, the proof is complete.
Lemma 9. 3. For $\alpha \in\left\{N_{2}, M_{2} \wedge M_{2}\right\}$ and $\kappa=\kappa_{\omega} \in\left\{M_{2} \wedge P, M_{2} \wedge N_{2}\right\}$ of Lemma 8.8 there holds the relation

$$
\gamma_{W}\left(1_{W} \wedge \alpha\right)^{*} \sigma^{-2} \gamma_{W \wedge M}=\sigma^{-2} \tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge \kappa\right)^{*} .
$$

Proof. For any $x \in \widehat{h}^{k}(W \wedge M \wedge N)$,

$$
\begin{aligned}
& \left(1_{W \wedge M} \wedge \pi_{0}\right)^{*} \gamma_{W \wedge M} x \\
& \quad=x-\mu\left(\sigma^{-2}\left(1_{W \wedge M} \wedge i_{0}\right) * x \otimes \pi_{1}^{*} \gamma_{1}\right) \\
& \quad=x-\left(1_{W \wedge M} \wedge \pi_{1}\right) * \sigma^{-2}\left(1_{W \wedge M} \wedge\left(i_{0} \wedge 1_{P}\right) T_{1}\right)^{*} \mu\left(x \otimes \gamma_{1}\right)
\end{aligned}
$$

for $T_{1}=T\left(P, S^{2}\right)$. Then, by (8.11),

$$
\begin{aligned}
& \left(1_{W} \wedge p_{0}\right)^{*}\left(1_{W} \wedge S^{2} \alpha\right)^{*} \gamma_{W \wedge M} x \\
& \quad=\left(1_{W} \wedge r\right)^{*}\left(1_{W \wedge M} \wedge \pi_{0}\right)^{*} \gamma_{W \wedge M} x \\
& \quad=\left(1_{W} \wedge r\right)^{*} x-x^{\prime},
\end{aligned}
$$

where $x^{\prime}=\sigma^{-2}\left(1_{W \wedge M} \wedge\left(i_{0} \wedge 1_{P}\right) T_{1}\right)^{*} \mu\left(x \otimes \gamma_{1}\right)$. Here

$$
\begin{aligned}
& \left(1_{W \wedge M} \wedge i_{P}\right) * x^{\prime} \\
& \quad=\sigma^{-2}\left(1_{W \wedge M} \wedge\left(i_{0} \wedge 1_{P}\right) T_{1}\left(S^{2} i_{P}\right)\right)^{*} \mu\left(x \otimes \gamma_{1}\right) \\
& \quad=\sigma^{-2}\left(1_{W \wedge M} \wedge\left(i_{0} \wedge 1_{P}\right)\left(1_{S} \wedge i_{P}\right)\right)^{*} \mu\left(x \otimes \gamma_{1}\right), \quad S=S^{2} \\
& \quad=\sigma^{-2}\left(1_{W \wedge M} \wedge i_{0} \wedge i_{P}\right)^{*} \mu\left(x \otimes \gamma_{1}\right) \\
& \quad=\sigma^{-2} \mu\left(\left(1_{W \wedge M} \wedge i_{0}\right) * x \otimes \sigma^{2} 1\right) \\
& \quad=\left(1_{W \wedge M} \wedge i_{0}\right) * x
\end{aligned}
$$

Hence

$$
\begin{aligned}
& \tilde{\boldsymbol{\gamma}}_{W \wedge M} x^{\prime}=\left(1_{W \wedge M} \wedge \pi_{P}\right)^{*-1}\left(x^{\prime}-\mu\left(\sigma^{-2}\left(1_{W \wedge M} \wedge i_{0}\right)^{*} x \otimes \gamma_{1}\right)\right) \\
& \quad=\left(1_{W \wedge M} \wedge \pi_{P}\right)^{*-1}\left(x^{\prime}-x^{\prime}\right)=0
\end{aligned}
$$

Thus

$$
\begin{array}{ll}
\tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge \kappa\right)^{*} x=\tilde{\gamma}_{W \wedge M}\left(\left(1_{W} \wedge \kappa\right)^{*} x-x^{\prime}\right) & \\
\quad=\tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge p_{0}\right)^{*}\left(1_{W} \wedge S^{2} \alpha\right)^{*} \gamma_{W \wedge M} x & \\
\quad=\sigma^{2} \gamma_{W}\left(1_{W} \wedge \alpha\right)^{*} \sigma^{-2} \gamma_{W \wedge M} x & \text { by Lemma } 9.2,
\end{array}
$$

i.e.,

$$
\sigma^{-2} \tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge \kappa\right)^{*}=\gamma_{W}\left(1_{W} \wedge \alpha\right)^{*} \sigma^{-2} \gamma_{W \wedge M} .
$$

9. 3. For any element $\xi \in\left\{M_{2} \wedge P, M_{2} \wedge M_{2} \wedge M_{2}\right\}$ we define a triple product

$$
\begin{equation*}
\tau_{\xi}: \widetilde{h}^{i}\left(X ; Z_{2}\right) \otimes \widetilde{h}^{j}\left(Y ; Z_{2}\right) \otimes \widetilde{h}^{k}\left(Z ; Z_{2}\right) \rightarrow \widehat{h}^{i+j+k}\left(W ; Z_{2}\right) \tag{9.5}
\end{equation*}
$$

as the composition

$$
\begin{align*}
\tau_{\xi}= & \sigma^{-4} \tilde{\gamma}_{W \wedge M} \xi^{* *} U^{*} \mu(1 \otimes \mu):  \tag{9.5'}\\
\widetilde{h}^{i} & \left(X ; Z_{2}\right) \otimes \widetilde{h}^{j}\left(\mathrm{Y} ; Z_{2}\right) \otimes \widetilde{h}^{k}\left(Z ; Z_{2}\right) \\
& =\widetilde{h}^{i+2}\left(X \wedge M_{2}\right) \otimes \widetilde{h}^{j+2}\left(Y \wedge M_{2}\right) \otimes \widetilde{h}^{k+2}\left(Z \wedge M_{2}\right) \\
& \rightarrow \widetilde{h}^{i+j+k+6}\left(X \wedge M_{2} \wedge Y \wedge M_{2} \wedge Z \wedge M_{2}\right) \\
& \rightarrow \widetilde{h}^{i+j+k+6}\left(W \wedge M_{2} \wedge M_{2} \wedge M_{2}\right) \\
& \rightarrow \widetilde{h}^{i+j+k+6}\left(W \wedge M_{2} \wedge P\right) \\
& \rightarrow \widetilde{h}^{i+j+k+6}\left(W \wedge M_{2} \wedge S^{4}\right) \\
& \rightarrow \widetilde{h}^{i+j+k+2}\left(W \wedge M_{2}\right)=\widetilde{h}^{i+j+k}\left(W ; Z_{2}\right),
\end{align*}
$$

where $W=X \wedge Y \wedge Z$ and $U: W \wedge M_{2} \wedge M_{2} \wedge M_{2} \rightarrow X \wedge M_{2} \wedge Y \wedge M_{2} \wedge Z \wedge M_{2}$ is the map given by a permutation of factors as $U\left(x, y, z, m, m^{\prime}, m^{\prime \prime}\right)=$ ( $x, m, y, m^{\prime}, z, m^{\prime \prime}$ ). $\tau_{\xi}$ is defined for all $(i, j, k)$ and natural with respect to three variables $X, Y$ and $Z$ by Lemma 9.1.

Denote by $T(2, h)$ the set of all triple products $\tau_{\xi}, \xi \in\left\{M_{2} \wedge P\right.$, $\left.M_{2} \wedge M_{2} \wedge M_{2}\right\}$. $\boldsymbol{\tau}_{\xi}=\boldsymbol{\tau}_{\xi^{\prime}}$ if and only if they are equal as natural transformations for all ( $i, j, k$ ). Clearly

$$
\tau_{\xi+\xi^{\prime}}=\tau_{\xi}+\tau_{\xi^{\prime}} .
$$

Thus $T(2, h)$ forms an additive group. Define a map

$$
\begin{equation*}
\tau_{2}:\left\{M_{2} \wedge P, M_{2} \wedge M_{2} \wedge M_{2}\right\} \rightarrow T(2, h) \tag{9.6}
\end{equation*}
$$

by $\tau_{2}(\xi)=\tau \xi$. Then, by definitions,
$\tau_{2}$ is an epimorphism of groups.
Since $\tilde{h}\left(; Z_{2}\right)$ is a functor of $Z_{2}$-modules by Proposition 3.2, $T(2, h)$ is a $Z_{2}$-module. Thus, by Theorem 8.6, (ii), and (9.6'),

$$
\begin{equation*}
T(2, h) \text { is a factor group of } Z_{2} \oplus Z_{2} \oplus Z_{2} \oplus Z_{2} \tag{9.7}
\end{equation*}
$$

9.4. Let $\alpha \in\left\{N_{2}, M_{2} \wedge M_{2}\right\}$ be an element of (4.18) and $\mu_{2}$ be the multiplication in $\tilde{h}\left(; Z_{2}\right)$ defined by (5.6) by making use of this $\alpha$ and $\gamma_{0}$ of (9.3). By (4.18') and Proposition 4.7, (i), both $\alpha$ and $\alpha^{\prime}=T \alpha$, $T=T\left(M_{2}, M_{2}\right)$, satisfy the condition of Lemma 8.8. Let $\kappa=\kappa_{a}$ and $\kappa^{\prime}=\kappa_{\omega^{\prime}}$ be the elements satisfying (8.11) for $\alpha$ and $\alpha^{\prime}$, respectively.

Lemma 9.4. $\mu_{2}\left(1 \otimes \mu_{2}\right)=\boldsymbol{\tau}_{\xi}$ and $\mu_{2}\left(\mu_{2} \otimes 1\right)=\tau_{\zeta}$ for $\xi=\left(1_{M} \wedge \alpha\right)_{\kappa}$ and $\zeta=T^{\prime}\left(1_{M} \wedge \alpha\right) \kappa^{\prime}, T^{\prime}=T\left(M_{2}, M_{2} \wedge M_{2}\right)$.

Proof. By definition

$$
\begin{aligned}
& \mu_{2}\left(1 \otimes \mu_{2}\right)= \sigma^{-2} \gamma \alpha^{* *}\left(1_{X} \wedge T_{2} \wedge 1_{M}\right)^{*} \mu\left(1_{X \wedge M} \otimes \sigma^{-2} \gamma \alpha^{* *}\left(1_{Y} \wedge T_{1} \wedge 1_{M}\right)^{*} \mu\right) \\
& \quad \text { for } T_{1}=T\left(Z, M_{2}\right) \text { and } T_{2}=T\left(Y \wedge Z, M_{2}\right) \\
&= \sigma^{-2} \gamma \alpha^{* *} \sigma^{-2}\left(1_{X} \wedge T_{2} \wedge S^{2} 1_{M}\right)^{*} \gamma \alpha^{* *}\left(1_{X \wedge M \wedge Y} \wedge T_{2} \wedge 1_{M}\right)^{*} \mu(1 \otimes \mu) \\
& \quad \text { by Lemma } 5.2, \text { (iv) } \\
&= \sigma^{-2} \gamma_{W} \alpha^{* *} \sigma^{-2} \gamma_{W \wedge M} \alpha^{* *} U^{*} \mu(1 \otimes \mu) \\
& \quad \quad \quad \text { for } W=X \wedge Y \wedge Z \text { and } U=\text { the map of }\left(9.5^{\prime}\right) \\
&= \sigma^{-4} \tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge \kappa\right)^{*} \alpha^{* *} U^{*} \mu(1 \otimes \mu) \quad \text { by Lemma } 9.3 \\
&= \tau_{\xi} .
\end{aligned}
$$

Next, using the commutativity and the associativity of $\mu$, we have

$$
\begin{aligned}
& \mu\left(\mu_{2} \otimes 1\right)(x \otimes y \otimes z)=T_{3}^{*} \mu\left(z \otimes \mu_{2}(x \otimes y)\right) \text { for } T_{3}=T(X \wedge Y \wedge M, Z \wedge M) \\
& =T_{3}^{*} \sigma^{-2} \gamma \alpha^{* *}\left(1_{Z \wedge M \wedge X} \wedge T_{4} \wedge 1_{M}\right)^{*} \mu(z \otimes \mu(x \otimes y)) \\
& \quad \text { for } T_{4}=T(Y, M) \\
& =T_{3}^{*} \sigma^{-2} \gamma \alpha^{* *}\left(1_{Z \wedge M \wedge X} \wedge T_{4} \wedge 1_{M}\right)^{*} T_{5}^{*} \mu(\mu(x \otimes y) \otimes z) \\
& \text { for } T_{5}=T(Z \wedge M, X \wedge M \wedge Y \wedge M) \\
& =T_{3}^{*} \sigma^{-2}\left(T_{6} \wedge S^{2} 1_{M}\right)^{*} \gamma_{W \wedge M}\left(T^{\prime}\left(1_{M} \wedge \alpha\right)\right)^{* *} U^{*} \mu(\mu \otimes 1)(x \otimes y \otimes z) \\
& \quad \text { for } T_{6}=T(Z \wedge M, X \wedge Y) \\
& =\left(1_{X \wedge Y} \wedge T_{7}\right)^{*} \sigma^{-2} \gamma_{W \wedge M}\left(T^{\prime}\left(1_{M} \wedge \alpha\right)\right)^{* *} U^{*} \mu(1 \otimes \mu)(x \otimes y \otimes z) \\
& \text { for } T_{7}=T(M, Z \wedge M)
\end{aligned}
$$

Thus,

$$
\begin{aligned}
\mu_{2}\left(\mu_{2} \otimes 1\right)= & \sigma^{-2} \gamma_{W} \alpha^{* *}\left(1_{X \wedge Y} \wedge T_{1} \wedge 1_{M}\right)^{*} \mu\left(\mu_{2} \otimes 1\right) \\
= & \sigma^{-2} \gamma_{W} \alpha^{* *} T^{* *} \sigma^{-2} \gamma_{W \wedge M}\left(T^{\prime}\left(1_{M} \wedge \alpha\right)\right)^{* *} U^{*} \mu(1 \otimes \mu) \\
= & \sigma^{-2} \gamma_{W} \alpha^{* * *} \sigma^{-2} \gamma_{W \wedge M}\left(1_{W} \wedge T^{\prime}\left(1_{M} \wedge \alpha\right)\right)^{*} U^{*} \mu(1 \otimes \mu) \\
= & \sigma^{-4} \tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge \kappa^{\prime}\right)^{*}\left(1_{W} \wedge T^{\prime}\left(1_{M} \wedge \alpha\right)\right)^{*} U^{*} \mu(1 \otimes \mu) \\
& \quad \text { by Lemma } 9.3 \\
= & \tau_{\zeta} .
\end{aligned}
$$

Let $\mu_{2}^{\prime}$ denote the admissible multiplication defined by

$$
\mu_{2}^{\prime}(x \otimes y)=T^{\prime \prime *} \mu_{2}(y \otimes x)
$$

for $x \in \widetilde{h}^{i}\left(X ; Z_{2}\right), y \in \widetilde{h}^{j}\left(Y ; Z_{2}\right)$ and $T^{\prime \prime}=T(X, Y)$. Then, by (7.2) and the similar computations as above, we obtain

Lemma 9.5. $\quad \mu_{2}\left(1 \otimes \mu_{2}^{\prime}\right)=\tau_{\xi^{\prime}}, \quad \mu_{2}^{\prime}\left(1 \otimes \mu_{2}\right)=\boldsymbol{\tau}_{\xi^{\prime \prime}}, \quad \mu_{2}\left(\mu_{2}^{\prime} \otimes 1\right)=\tau_{\zeta^{\prime}} \quad$ and $\mu_{2}^{\prime}\left(\mu_{2} \otimes 1\right)=\tau_{\zeta^{\prime \prime}}$ for $\xi^{\prime}=\left(1_{M} \wedge \alpha^{\prime}\right) \kappa, \quad \xi^{\prime \prime}=\left(1_{M} \wedge \alpha\right) \kappa^{\prime}, \quad \zeta^{\prime}=T^{\prime}\left(1_{M} \wedge \alpha^{\prime}\right) \kappa^{\prime} \quad$ and $\zeta^{\prime \prime}=T^{\prime}\left(1_{M} \wedge \alpha\right) \kappa$.
9.5. Here we discuss first the case of $h=K$.

Lemma 9.6. In case $h=K, \beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(1 \otimes \delta_{2} \otimes \delta_{2}\right), \beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes 1\right.$ $\left.\otimes \delta_{2}\right)$ and $\beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes \delta_{2} \otimes 1\right)$ are triple products.

Proof. By Corollary 7.8 and $\left(\Lambda_{3}\right)$ for $\mu_{2}$ we have

$$
\begin{aligned}
\beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(1 \otimes \delta_{2} \otimes \delta_{2}\right) & =\beta_{2} \mu_{2}\left(1 \otimes \mu_{2}\right)\left(1 \otimes \delta_{2} \otimes \delta_{2}\right) \\
& =\mu_{2}\left(1 \otimes \mu_{2}^{\prime}\right)+\mu_{2}\left(1 \otimes \mu_{2}\right), \\
\beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes \delta_{2} \otimes 1\right) & =\mu_{2}\left(\mu_{2}^{\prime} \otimes 1\right)+\mu_{2}\left(\mu_{2} \otimes 1\right),
\end{aligned}
$$

and

$$
\begin{aligned}
& \beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes 1 \otimes \delta_{2}\right) \\
& \quad=\mu_{2}^{\prime}\left(1 \otimes \mu_{2}\right)+\mu_{2}\left(1 \otimes \mu_{2}\right)+\beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes \delta_{2} \otimes 1\right) \\
& \quad=\mu_{2}^{\prime}\left(1 \otimes \mu_{2}\right)+\mu_{2}\left(1 \otimes \mu_{2}\right)+\mu_{2}\left(\mu_{2}^{\prime} \otimes 1\right)+\mu_{2}\left(\mu_{2} \otimes 1\right) .
\end{aligned}
$$

Thus, as sums of triple products, they are triple products. q.e.d.
Lemma 9. 7. $\mu_{2}\left(\mu_{2} \otimes 1\right), \beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(1 \otimes \delta_{2} \otimes \delta_{2}\right), \beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes 1 \otimes \delta_{2}\right)$ and $\beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes \delta_{2} \otimes 1\right)$ form a base of $T(2, K)$.

By Proposition 3.4, $\mu_{2}\left(\mu_{2}\left(\kappa_{i} \otimes \kappa_{j}\right) \otimes \kappa_{k}\right), 1 \leqq i, j, k \leqq 2$, form a base of $\tilde{K}^{*}\left(M_{2} \wedge M_{2} \wedge M_{2} ; Z_{2}\right)$. Applying the four triple products on $\kappa_{2} \otimes \kappa_{1} \otimes \kappa_{1}$, $\kappa_{1} \otimes \kappa_{2} \otimes \kappa_{1}$ and $\kappa_{1} \otimes \kappa_{1} \otimes \kappa_{2}$ we see their linear independence. Then, by (9.7), we conclude the lemma and see also that

$$
\begin{equation*}
T(2, K) \cong Z_{2} \oplus Z_{2} \oplus Z_{2} \oplus Z_{2} \tag{9.8}
\end{equation*}
$$

and

$$
\text { in case } h \cong K, \tau_{2}^{-1}(0)=2 \cdot\left\{M_{2} \wedge P, M_{2} \wedge M_{2} \wedge M_{2}\right\} .
$$

Lemma 9.8. $\mu_{2}\left(\mu_{2} \otimes 1\right)=\mu_{2}\left(1 \otimes \mu_{2}\right)$ in case $h=K$.
Proof. By the above lemma we can express $\mu_{2}\left(1 \otimes \mu_{2}\right)$ as a linear combination of $\mu_{2}\left(\mu_{2} \otimes 1\right), \beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(1 \otimes \delta_{2} \otimes \delta_{2}\right), \beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes 1 \otimes \delta_{2}\right)$ and $\beta_{2} \mu_{2}\left(\mu_{2} \otimes 1\right)\left(\delta_{2} \otimes \delta_{2} \otimes 1\right)$. By $\left(\Lambda_{3}\right) \quad \mu_{2}\left(1 \otimes \mu_{2}\right)$ and $\mu_{2}\left(\mu_{2} \otimes 1\right)$ have the same values on $\kappa_{2} \otimes \kappa_{1} \otimes \kappa_{1}, \kappa_{1} \otimes \kappa_{2} \otimes \kappa_{1}$, and $\kappa_{1} \otimes \kappa_{1} \otimes \kappa_{2}$, which means theat

$$
\mu_{2}\left(1 \otimes \mu_{2}\right)=\mu_{2}\left(\mu_{2} \otimes 1\right)
$$

by the argument in the proof of Lemma 9.7.
q.e.d.

By ( $9.8^{\prime}$ ), Lemmas 9.4 and 9.8 we see that

$$
\xi-\zeta \in 2 \cdot\left\{M_{2} \wedge P, M_{2} \wedge M_{2} \wedge M_{2}\right\},
$$

that is,

$$
\tau_{\xi}=\tau_{\zeta}
$$

for any $h$ satisfying $\eta^{* *}=0$. Hence we obtain

Theorem 9.9. Let $\mu$ be a commutative and associative multiplication in $\tilde{h}$ and $\eta^{* *}=0$ in $\widehat{h}$. There exists an associative admissible multiplication $\mu_{2}$ in $\tilde{h}\left(; Z_{2}\right)$.

By Corollary 7.7 and Theorem 9.9 we have
Corollary 9.10. Under the assumption of Theorem 9.9 and $\bar{\eta}^{* *}=0$, there exists a commutative and associative admissible $\mu_{2}$ in $\widehat{h}\left(; Z_{2}\right)$.

## 10. Associativity of $\bmod q$ multiplications $(\boldsymbol{q} \neq 2)$.

10.1. Let $\tilde{h}$ be given with a commutative and associative multiplication $\mu$. For each element $\xi \in\left\{S^{4} M_{q}, M_{q} \wedge M_{q} \wedge M_{q}\right\}$ we define a triple product

$$
\begin{equation*}
\tau_{\xi}: \widetilde{h}^{i}\left(X ; Z_{q}\right) \otimes \widetilde{h}^{j}\left(Y ; Z_{q}\right) \otimes \widetilde{h}^{k}\left(Z ; Z_{q}\right) \rightarrow \widetilde{h}^{i+j+k}\left(W ; Z_{q}\right) \tag{10.1}
\end{equation*}
$$

as the composition

$$
\begin{align*}
\tau_{\xi}= & \sigma^{-4} \xi^{* *} U^{*} \mu(1 \otimes \mu): \\
& \tilde{h}^{i}\left(X ; Z_{q}\right) \otimes \widetilde{h}^{j}\left(Y ; Z_{q}\right) \otimes \widetilde{h}^{k}\left(Z ; Z_{q}\right) \\
= & \widetilde{h}^{i+2}\left(X \wedge M_{q}\right) \otimes \widetilde{h}^{j+2}\left(Y \wedge M_{q}\right) \otimes \widetilde{h}^{k+2}\left(Z \wedge M_{q}\right) \\
\rightarrow & \widetilde{h}^{i+j+k+6}\left(X \wedge M_{q} \wedge Y \wedge M_{q} \wedge Z \wedge M_{q}\right) \\
\rightarrow & \widetilde{h}^{i+j+k+6}\left(W \wedge M_{q} \wedge M_{q} \wedge M_{q}\right) \\
\rightarrow & \widetilde{h}^{i+j+k+6}\left(W \wedge S^{4} M_{q}\right) \\
\rightarrow & \widetilde{h}^{i+j+k+2}\left(W \wedge M_{q}\right)=\widetilde{h}^{i+j+k}\left(W ; Z_{q}\right),
\end{align*}
$$

where $W=X \wedge Y \wedge Z$ and $U: W \wedge M_{q} \wedge M_{q} \wedge M_{q} \rightarrow X \wedge M_{q} \wedge Y \wedge M_{q} \wedge Z \wedge M_{q}$ is the similar map as the corresponding one in (9.5'). $\tau_{\xi}$ is defined for all ( $i, j, k$ ) and natural with respect to three variables $X, Y$ and $Z$.

Similarly to 9.3 we denote by $T(q, h)$ the set of all triple products $\tau_{\xi}, \xi \in\left\{S^{4} M_{q}, M_{q} \wedge M_{q} \wedge M_{q}\right\}$. By an easy relation

$$
\boldsymbol{\tau}_{\xi+\zeta}=\boldsymbol{\tau}_{\xi}+\boldsymbol{\tau}_{\zeta}
$$

$T(q, h)$ forms an additive group, and the map

$$
\begin{equation*}
\tau_{q}:\left\{S^{4} M_{q}, M_{q} \wedge M_{q} \wedge M_{q}\right\} \rightarrow T(q, h) \tag{10.2}
\end{equation*}
$$

defined by $\tau_{q}(\xi)=\tau_{\xi}$ satisfies

$$
\begin{equation*}
\tau_{q} \text { is an epimorphism of groups. } \tag{10.2'}
\end{equation*}
$$

10.2. We shall discuss the case $q \neq 2(\bmod 4)$. Choosing an $\bar{\alpha}$ of (4.17) and using notations of (7.6), by Proposition 7.9, (i), we have a direct sum decomposition

$$
\begin{align*}
& \left\{S^{4} M_{q}, M_{q} \wedge M_{q} \wedge M_{q}\right\}  \tag{10.3}\\
& \quad=(1 \wedge i \wedge i)_{*}\left\{S^{4} M_{q}, S^{2} M_{q}\right\} \oplus\left(i^{\prime \prime} \wedge i\right)_{*}\left\{S^{4} M_{q}, S^{3} M_{q}\right\} \\
& \\
& \quad \oplus\left(1 \wedge i^{\prime \prime}\left(S^{2} i\right)\right)_{*}\left\{S^{4} M_{q}, S^{3} M_{q}\right\} \oplus\left(\left(1 \wedge i^{\prime \prime}\right) S^{2} i^{\prime \prime}\right)_{*}\left\{S^{4} M_{q}, S^{4} M_{q}\right\} \\
& \simeq\left\{\begin{array}{cc}
Z_{(q, 24} \oplus Z_{q} & \text { if } q \text { is odd } \\
\left(Z_{2} \oplus Z_{2} \oplus Z_{2} \oplus Z_{(q, 24)}\right) \oplus\left(Z_{2} \oplus Z_{2} \oplus Z_{2}\right) \oplus\left(Z_{2} \oplus Z_{2} \oplus Z_{2}\right) \\
\oplus\left(Z_{q} \oplus Z_{2}\right) & \text { if } q \equiv 0(\operatorname{mood} 4)
\end{array}\right.
\end{align*}
$$

by Theorem 4.1 , where $(1 \wedge i \wedge i)_{*},\left(i^{\prime \prime} \wedge i\right)_{*},\left(1 \wedge i^{\prime \prime}\left(S^{2} i\right)\right)_{*}$ and $\left(\left(1 \wedge i^{\prime \prime}\right) S^{2} i^{\prime \prime}\right)_{*}$ are all monomorphic.

Here we make an assumption that
(10.4) $\left(\eta \pi_{q}\right)^{* *}=\left(\nu \pi_{q}\right)^{* *}=\left(1_{M} \wedge \eta\right)^{* *}=0$ in $\hat{h}$, where $\eta$ and $\nu$ are Hopf maps of 1 -stem and 3-stem respectively, and $M=M_{q}$.

Under this assumption $(i \eta \pi)^{* *}=(i \nu \pi)^{* *}=\left(i \eta^{2} \pi\right)^{* *}=0,\left(\eta_{1}+\eta_{2}\right)^{* *}=$ $\left(1_{M} \wedge \eta\right)^{* *}=0$ by Lemma 7.2, $\eta_{1}^{2 * *}=\left(i \eta \pi \eta_{3}\right)^{* *}=0$ and $\eta_{2}^{2 * *}=\left(\eta_{3} i \eta \pi\right)^{* *}=0$ by Corollary 4.2, (i). Thus, defining $A$ as a subgroup of $\left\{S^{4} M_{q}, M_{q} \wedge M_{q} \wedge M_{q}\right\}$ generated by $(1 \wedge i \wedge i)_{*}(i \eta \pi)$ in case $q$ odd, or by $\left\{(1 \wedge i \wedge i)_{*}\right.$-images of of $\eta_{1}^{2}, \eta_{2}^{2}$ and $i \nu \pi,\left(i^{\prime \prime} \wedge i\right)^{*}$ and $\left(1 \wedge i^{\prime \prime}\left(S^{2} i\right)\right)_{*}$-images of $\eta_{1}+\eta_{2}$ and $i \eta^{2} \pi$, $\left.\left(\left(1 \wedge i^{\prime \prime}\right) S^{2} i^{\prime \prime}\right)_{*}(i \eta \pi)\right\}$, we see that $\tau_{q}$ factors through the projection: $\left\{S^{4} M_{q}, M_{q} \wedge M_{q} \wedge M_{q}\right\} \rightarrow\left\{S^{4} M_{q}, M_{q} \wedge M_{q} \wedge M_{q}\right\} / A=B$, say, and induces an epimorphism

$$
\begin{equation*}
\tau_{q}^{\prime}: B \rightarrow T(q, h) . \tag{10.5}
\end{equation*}
$$

Now, by (10.3) and the definition of $A$ we have

$$
B \cong \begin{cases}Z_{q} & \text { if } q \text { is odd } \\ Z_{2} \oplus Z_{2} \oplus Z_{2} \oplus Z_{q} & \text { if } q \equiv 0(\bmod 4)\end{cases}
$$

Putting $\gamma_{0}=\pi^{*}\left(\sigma^{2} 1\right)$, define an admissble $\mu_{q}$ by (5.6'). Then it satisfies (5. $6^{\prime \prime}$ ). Remarking that $\alpha i^{\prime}=i^{\prime \prime}$ by (7.5)-(7.6), routine calculations give a proof of the following

Lemma 10.1. $\mu_{q}\left(1 \otimes \mu_{q}\right)=\tau_{\xi}$ and $\mu_{q}\left(\mu_{q} \otimes 1\right)=\tau_{\zeta}$ for $\xi=\left(1_{M} \wedge i^{\prime \prime}\right) S^{2} i^{\prime \prime}$ and $\zeta=\left(i^{\prime \prime} \wedge 1_{M}\right)\left(1_{M} \wedge T\right) S^{2} i^{\prime \prime}$, where $M=M_{q}$ and $T=T\left(M_{q}, S^{2}\right)$.

In case $q \equiv 0(\bmod 4)$, define elements

$$
\tilde{i}^{\prime} \in\left\{S^{2} M_{q}, N_{q}\right\} \quad \text { and } \quad \tilde{\pi}^{\prime} \in\left\{N_{q}, S M_{q}\right\}
$$

by

$$
\tilde{i}^{\prime}=i^{\prime}+i_{0} \bar{\eta} \quad \text { and } \quad \tilde{\pi}^{\prime}=\pi^{\prime}+\bar{\eta} \pi_{0} .
$$

Then, the obvious relation $1=i_{0} \pi^{\prime}+i^{\prime} \pi_{0}$ (which was used in the proof of (5.4')) and $2 \cdot \bar{\eta}=0$ (in the present case) imply the relation

$$
1=i_{0} \widetilde{\pi}^{\prime}+\tilde{i}^{\prime} \pi_{0}
$$

We define $\gamma_{W}^{\prime}$ as $\gamma_{W}$ of (5.4) making use of $\tilde{\pi}^{\prime *}\left(\sigma^{2} 1\right)$ as $\gamma_{0}$; the above relation implies the formula

$$
\gamma_{W}^{\prime}=\left(1_{W} \wedge \tilde{i^{\prime}}\right)^{*}
$$

as in the proof of (5.4'). Define an admissible $\mu_{q}^{\prime}$ by ( $5.6^{\prime}$ ) making use of the $\alpha$ and the $\gamma_{W}^{\prime}$, then we have

Lemma 10.2. $\mu_{q}\left(1 \otimes \mu_{q}^{\prime}\right)=\tau_{\xi}, \mu_{q}^{\prime}\left(1 \otimes \mu_{q}\right)=\tau_{\xi^{\prime \prime}}$ and $\mu_{q}\left(\mu_{q}^{\prime} \otimes 1\right)=\boldsymbol{\tau}_{\zeta^{\prime}}$ for $\xi^{\prime}=\left(1_{M} \wedge \alpha \tilde{i^{\prime}}\right) S^{2} i^{\prime \prime}, \xi^{\prime \prime}=\left(1_{M} \wedge i^{\prime \prime}\right) S^{2}\left(\alpha \tilde{i^{\prime}}\right)$ and $\zeta^{\prime}=\left(\alpha \tilde{i^{\prime}} \wedge i^{\prime \prime}\right)\left(1_{M} \wedge T\right) S^{2} i^{\prime \prime}, \quad T=$ $T\left(M_{q}, S^{2}\right)$.

The proof is routine likely as Lemma 10.1 .
10.3. We shall discuss in a parallel way to 9.5 , i.e., first the case $h=K$. In this case the assumption (10.4) is satisfied by Theorem 2.3.

Lemma 10.3. In case $h=K$ and $q \equiv 0(\bmod 4)$,

$$
(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(1 \otimes \delta_{q} \otimes \delta_{q}\right), \quad(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(\delta_{q} \otimes 1 \otimes \delta_{q}\right)
$$

$$
\text { and } \quad(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(\delta_{q} \otimes \delta_{q} \otimes 1\right)
$$

are triple products.
Proof. By definitions

$$
\begin{aligned}
\mu_{q}^{\prime}-\mu_{q} & =\sigma^{-2}\left(\alpha i_{i} \bar{\eta}\right)^{* *}\left(1_{X} \wedge T \wedge 1_{M}\right) \mu & & \text { for } T=T\left(Y, M_{q}\right) \\
& =\sigma^{-2} \bar{\eta}^{* *}(i \wedge i)^{* *}\left(1_{X} \wedge T \wedge 1_{M}\right) \mu & & \text { by }\left(4.18^{\prime}\right) \\
& =(q / 2) \cdot \beta \pi^{* *}(i \wedge i)^{* *}\left(1_{X} \wedge T \wedge 1_{M}\right) \mu & & \text { by Proposition } 6.4 \\
& =(q / 2) \cdot \beta_{q} \mu_{q}\left(\delta_{q} \otimes \delta_{q}\right) . & &
\end{aligned}
$$

Then, as differences of triple products, the following are also triple products:

$$
\begin{aligned}
& \mu_{q}\left(1 \otimes \mu_{q}^{\prime}\right)-\mu_{q}\left(1 \otimes \mu_{q}\right)=\mu_{q}\left(1 \otimes\left(\mu_{q}^{\prime}-\mu_{q}\right)\right) \\
&=(q / 2) \cdot \mu_{q}\left(1 \otimes \beta_{q} \mu_{q}\left(\delta_{q} \otimes \delta_{q}\right)\right) \\
&=(q / 2) \cdot \beta_{q} \mu_{q}\left(1 \otimes \mu_{q}\right)\left(1 \otimes \delta_{q} \otimes \delta_{q}\right) \\
&=(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(1 \otimes \delta_{q} \otimes \delta_{q}\right) \quad \text { by } \quad\left(\Lambda_{3}\right) \\
& \mu_{q}\left(\mu_{q}^{\prime} \otimes 1\right)-\mu_{q}\left(\mu_{q} \otimes 1\right)=(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(\delta_{q} \otimes \delta_{q} \otimes 1\right), \\
& \mu_{q}^{\prime}\left(1 \otimes \mu_{q}\right)-\mu_{q}\left(1 \otimes \mu_{q}\right)=(q / 2) \cdot \beta_{q} \mu_{q}\left(\delta_{q} \otimes \delta_{q} \mu_{q}\right) \\
&=(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(\delta_{q} \otimes \delta_{q} \otimes 1+\delta_{q} \otimes 1 \otimes \delta_{q}\right)
\end{aligned}
$$

Lemma 10.4. In case $q \equiv 0(\bmod 4)$,

$$
\begin{aligned}
& \mu_{q}\left(\mu_{q} \otimes 1\right), \quad(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(1 \otimes \delta_{q} \otimes \delta_{q}\right), \quad(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(\delta_{q} \otimes 1 \otimes \delta_{q}\right) \\
& \text { and } \quad(q / 2) \cdot \beta_{q} \mu_{q}\left(\mu_{q} \otimes 1\right)\left(\delta_{q} \otimes \delta_{q} \otimes 1\right)
\end{aligned}
$$

generate $T(q, K)$.

The linear independence of the four triple products (with $\mu_{q}\left(\mu_{q} \otimes 1\right)$ replaced by $\left.(q / 2) \cdot \mu_{q}\left(\mu_{q} \otimes 1\right)\right)$ over $Z_{2}$, can be seen in the same way as in the proof of Lemma 9.7. Since $\mu_{q}\left(\mu_{q} \otimes 1\right)$ is exactly of order $q$ as is easily seen, the proof is completed by ( $10.5^{\prime}$ ). We can also conclude that

$$
\begin{equation*}
\tau_{q}^{\prime-1}(0) \cong 0 \tag{10.6}
\end{equation*}
$$

by $\left(10.5^{\prime}\right)$ in case $h=K$ and $q \neq 2(\bmod 4)$.
Lemma 10.5. In case $h=K$ and $q \neq 2(\bmod 4)$

$$
\mu_{q}\left(\mu_{q} \otimes 1\right)=\mu_{q}\left(1 \otimes \mu_{q}\right)
$$

Proof. A similar discussion as the proof of Lemma 9.8 shows that

$$
\mu_{q}\left(1 \otimes \mu_{q}\right)=s \cdot \mu_{q}\left(\mu_{q} \otimes 1\right)
$$

for $s \equiv 0(\bmod q)$. Then $\left(\Lambda_{3}\right)$ implies that

$$
s \equiv 1 \quad(\bmod q) . \quad \text { q.e.d. }
$$

10.4. Lemma 10.5 and (10.6) imply that

$$
\xi \equiv \zeta \quad \bmod A
$$

i.e.,

$$
\tau_{\xi}=\tau_{\zeta}
$$

for any $h$ satisfying (10.4) for the case $q \neq 2(\bmod 4)$. Thus $\mu_{q}$ is associative under the assumption (10.4). Since we can choose the $\mu_{q}$ used in $\S 7$ as the same one used here, we obtain

Theorem 10.6. Let $\hat{h}$ be given with a commutative and associative multiplication. In case $q \equiv 2(\bmod 4)$, if $\hat{h}$ satisfies $\left(\eta \pi_{q}\right)^{* *}=\left(\nu \pi_{q}\right)^{* *}=$ $\left(1_{M} \wedge \eta\right)^{* *}=0, M=M_{q}$, then there exists a commutative and associative admissible multiplication in $\widehat{h}\left(; Z_{q}\right)$, which is unique in case $q$ odd.

The conditions of Theorem 10.6 are satisfied always if $q$ is prime to 2 and 3 , or if $q$ is odd and $\left(\nu \pi_{q}\right)^{* *}=0$.

In case $q \equiv 2(\bmod 4)$, from Theorems $3.14,9.9$ and 10.6 follows
Theorem 10.7. Let $\hat{h}$ be equipped with a commutative and associative multiplication $\mu$ and $q \equiv 2(\bmod 4)$. If $\hat{h}$ satisfies $\eta^{* *}=\nu^{* *}=0$ (or $\eta^{* *}=$ $\nu^{* *}=\bar{\eta}^{* *}=0$ ), then there exists an associative (or a commutative and associative) admissible multiplication in $\widetilde{h}\left(; Z_{q}\right)$.

By Corollary 3.13, (6.1), Theorems 9.9, 10.6 and 10.7 we have

- ary 10.8. For any integer $q>1$ every admissible multiplication is associative.

In case $q$ odd, $\widetilde{K O}\left(; Z_{q}\right)$ has a unique admissible $\mu_{q}\left(\right.$ since $\widetilde{K O}^{-2}\left(S^{0} ; Z_{q}\right)$ $\cong 0$ ) and satisfies the assumption of Theorem 10.6. Hence

Corollary 10.9. For $q$ odd, the unique admissible multiplication in $\widetilde{K O}\left(; Z_{q}\right)$ is commutative and associative.

## 11. Multiplications in Bockstein spectral sequences.

11.1. Let $h$ be a cohomology theory and $p$ a prime. Define a (mono-graded) exact couple [11]

$$
\widetilde{C}_{1}\left(X ; Z_{p}\right)=\left\{\widetilde{D}_{1}^{*}\left(X ; Z_{p}\right), \widetilde{E}_{1}^{*}\left(X ; Z_{p}\right), i_{1}, j_{1}, k_{1}\right\}
$$

by putting

$$
\begin{aligned}
& \widetilde{D}_{1}^{*}\left(X ; Z_{p}\right)=\sum_{i} \widetilde{D}_{1}^{i}\left(X ; Z_{p}\right), \quad \widetilde{E}_{1}^{*}\left(X ; Z_{p}\right)=\sum_{i} \widetilde{E}\left(X ; Z_{p}\right), \\
& \widetilde{D}_{1}^{i}\left(X ; Z_{p}\right)=\widetilde{h}^{i}(X), \quad \widetilde{E}_{1}^{i}\left(X ; Z_{p}\right)=\widetilde{h}^{i}\left(X ; Z_{p}\right), \\
& i_{1}=p, j_{1}=\rho_{p} \text { and } k_{1}=\delta_{p, 0},
\end{aligned}
$$

where $p$ is a map sending every element to its $p$ times. The exactness of (2.3) shows that $\widetilde{C}_{1}\left(X ; Z_{p}\right)$ is an exact couple. From the successive derived couples

$$
\widetilde{C}_{r}\left(X ; Z_{p}\right)=\left(\widetilde{D}_{r}^{*}\left(X ; Z_{p}\right), \widetilde{E}_{r}^{*}\left(X ; Z_{p}\right), i_{r}, j_{r}, k_{r}\right\}, \quad r \geq 1,
$$

we obtain a (mono-graded) spectral sequence

$$
\left\{\widetilde{E}_{r}^{*}\left(X ; Z_{p}\right)=\sum_{i} \widetilde{E}_{r}^{i}\left(X ; Z_{p}\right), \quad r \geq 1\right\} \quad \text { with } \quad d_{r}=j_{r} k_{r}
$$

which is called the $\bmod p$ Bockstein spectral sequence of $X$ for $\tilde{h}$.
The naturality is clear. Replacing $X$ by $X^{+}$we obtain the $\bmod p$ Bockstein spectral sequence $\left\{E_{r}^{*}\left(X ; Z_{p}\right), r \geq 1\right\}$ of $X$ for $h$. By the definition of derived couples we see that

$$
\tilde{D}_{r}^{*}\left(X ; Z_{p}\right)=p^{r-1} \cdot \tilde{h}^{*}(X) \quad \text { for } \quad r \geq 1
$$

When $h$ is of finite type, i.e., $h^{i}$ (a point) is finitely generated for each $i$, then $\tilde{h}^{*}(X)$ is of finite type for any $X$ (finite $C W$-complexes); thus every Bockstein spectral sequences for $\widetilde{h}$ converge to an $\widetilde{E}_{\infty}^{*}$-term.
11. 2. The Bockstein spectral sequences for $\tilde{h}$ have many analogous properties to the ordinary Bockstein spectral sequences. The proofs are also similar to the ordinary cases if we use (2.3), (2.7) and (2.10) (instead of the choice of canonical basis as is often seen in literature). So we give only a sketch of them and the proofs are left to readers.

Proposition 11.1. $\rho_{p^{r}, p}: \widetilde{h}^{i}\left(X ; Z_{p^{r}}\right) \rightarrow \widetilde{h}^{i}\left(X ; Z_{p}\right)$ and $\rho_{p}: \widetilde{h}^{i}(X) \rightarrow$ $\widetilde{h}^{i}\left(X ; Z_{p}\right)$ induce homomorphisms
and

$$
\begin{aligned}
& l_{r}: \widetilde{h}^{i}\left(X ; Z_{p^{r}}\right) \rightarrow \widetilde{E}_{r}^{i}\left(X ; Z_{p}\right) \\
& q_{r}: \widetilde{h}^{i}(X) \rightarrow \widetilde{E}_{r}^{i}\left(X ; Z_{p}\right),
\end{aligned}
$$

and the following diagram

is commutative for all $i$ and $r \geq 1$, where $p^{r-1}$ is a map sending $x \in \widetilde{h}^{i}(X)$ to $p^{r-1} \cdot x \in \widetilde{D}_{r}^{i}\left(X ; Z_{p}\right)$.

The proposition is clear for $r=1$ by putting $l_{1}=i d$ and $q_{1}=\rho_{p}$. By an induction on $r$, we can prove this proposition.

Proposition 11.2. (i) $q_{r}^{-1}(0)=\delta_{p^{r-1}, ~} \widetilde{h}^{i-1}\left(X ; Z_{p^{r-1}}\right)+p \cdot \widetilde{h}^{i}(X)$.
(ii) $l_{r}^{-1}(0)=\delta_{p^{r-1}, p^{r}} \widetilde{h}^{i-1}\left(X ; Z_{p^{r-1}}\right)+p_{*} \widetilde{h}^{i}\left(X ; Z_{p^{r-1}}\right)$ for $p_{*}: \widetilde{h}^{i}\left(X ; Z_{p^{r-1}}\right) \rightarrow \widehat{h}^{i}\left(X ; Z_{p^{r}}\right)$ of $(2.6)$.
(iii) $l_{r}$ is epimorphic.
(iv) $l_{r} \rho_{p^{r+1}, p^{r}} \tilde{h}^{i}\left(X ; Z_{p^{r+1}}\right)=d_{r}^{-1}(0)$ in $\widetilde{E}_{r}^{i}\left(X ; Z_{p}\right)$.

In the above proposition we regard $\tilde{h}^{*}\left(X ; Z_{p^{0}}{ }^{0}\right)=\{0\}$. Properties (i)-(iv) of the above proposition can be proved by a simultaneous induction on $r$.

Corollary 11.3. If $h$ is of finite type, then the homomorphism

$$
q_{\infty}: \widetilde{h}^{i}(X) \rightarrow \widetilde{E}_{\infty}^{i}\left(X ; Z_{p}\right)
$$

is induced by $\rho_{p}$ for each $i$ and epimorphic, and

$$
q_{\infty}^{-1}(0)=\sum_{s \geq 1} \delta_{p s, 0} \widetilde{h}^{i-1}\left(X ; Z_{p^{s}}\right)+p \cdot \tilde{h}^{i}(X)
$$

For any abelian group $G$ we identify $\operatorname{Tor}\left(G, Z_{q}\right)$ with the subgroup of $G$ consisting of all $x \in G$ such that $q \cdot x=0$. Then, by the exactness of (2.3)

$$
\delta_{p^{r}, \widetilde{h}^{i-1}}\left(X ; Z_{p^{r}}\right)=\operatorname{Tor}\left(\widetilde{h}^{i}(X), Z_{p^{r}}\right) .
$$

Thus

$$
\begin{equation*}
q_{r}^{-1}(0)=\operatorname{Tor}\left(\widehat{h}^{i}(X), Z_{p^{r-1}}\right)+p \cdot \widetilde{h}^{i}(X) \tag{11.1}
\end{equation*}
$$

and

$$
\begin{equation*}
l_{r}^{-1}(0)=\rho_{r} \operatorname{Tor}\left(\widetilde{h}^{i}(X), Z_{p^{r-1}}\right)+p_{*} \widetilde{h}^{i}\left(X ; Z_{p^{r-1}}\right) \tag{11.2}
\end{equation*}
$$

for all $i$. If $h$ is of finite type, then

$$
\begin{aligned}
q_{\infty}^{-1}(0) & =\sum_{s \geq 1} \operatorname{Tor}\left(\widetilde{h}^{i}(X), Z_{p^{s}}\right)+p \cdot \widetilde{h}^{i}(X) \\
& =p \text {-tors } \widetilde{h}^{i}(X)+p \cdot \widetilde{h}^{i}(X) \\
& =\text { tors } \widetilde{h}^{i}(X)+p \cdot \widetilde{h}^{i}(X),
\end{aligned}
$$

where tors $G$ (or $p$-tors $G$ ) denotes the subgroup of $G$ consisting of all torsion elements (or of all torsion elements of $p$-primary order). Thus we have

Theorem 11.4. If $h$ is of finite type, then

$$
\widetilde{E}_{\infty}^{i}\left(X ; Z_{p}\right) \cong\left(\tilde{h}^{i}(X) / \text { tors } \tilde{h}^{i}(X)\right) \otimes Z_{p}
$$

for all $i$.
$l_{r}, q_{r}$ and $\delta_{p^{r}, 0}$ induce the corresponding maps in the following diagram (denoted with primes):

$$
\begin{aligned}
\widetilde{h}^{i-1}(X ; & \left.Z_{p^{r}}^{\prime}\right) / l_{r}^{-1}(0) \\
& \xrightarrow{\delta_{p^{r}, 0}^{\prime}} \widetilde{h}^{i}(X) / q_{r}^{-1}(0) \\
& l_{r}^{\prime} \\
\widetilde{E}_{r}^{i-1}\left(X ; Z_{p}\right) & \xrightarrow{d_{r}} \widetilde{E}_{r}^{\prime}\left(X ; Z_{p}\right),
\end{aligned}
$$

which is commutative by Proposition 11.1. $l_{r}^{\prime}$ is isomorphic and $q_{r}^{\prime}$ is monomorphic by Proposition 11.2. Thus

$$
\begin{aligned}
d_{r} \widetilde{E}_{r}^{i-1}\left(X ; Z_{p}\right) & \cong \delta_{p^{r}, 0}^{\prime}\left(\widetilde{h}^{i-1}\left(X ; Z_{p^{r}}\right) / l_{r}^{-1}(0)\right) \\
& \cong\left(\operatorname{Tor}\left(\widetilde{h}^{i}(X), Z_{p^{r}}\right)+p \cdot \widetilde{h}^{i}(X)\right) /\left(\operatorname{Tor}\left(\widetilde{h}^{i}(X), Z_{p^{r-1}}\right)+p \cdot \widetilde{h}^{i}(X)\right) \\
& \left.\cong \operatorname{Tor}\left(\widetilde{h}^{i}(X), Z_{p^{r}}\right)\right) /\left(\operatorname{Tor}\left(\widetilde{h}^{i}(X), Z_{p^{r-1}}\right)+p \cdot \operatorname{Tor}\left(\widehat{h}^{i}(X), Z_{p^{r+1}}\right)\right),
\end{aligned}
$$

by which we obtain
Theorem 11.5. $d_{r} \widetilde{E}_{r}^{i-1}\left(X ; Z_{p}\right)$ is a $Z_{p}$-module for every $i$ and $r \geq 1$. When $h$ is of finite type, then $\operatorname{dim} d_{r} \widetilde{E}_{r}^{i-1}\left(X ; Z_{p}\right)$ is equal to the number of direct summands isomorphic to $Z_{p^{r}}$ in a direct sum decomposition of tors $\widetilde{h}^{i}(X)$ into cyclic groups of primary orders.

By Theorems 11.4 and 11.5 we see that, in case $h$ is of finite type, if we know Bockstein spectral sequences for all prime $p$ then we can determine $\widehat{h}^{*}(X)$ additively.
11. 3. Let $p$ be a prime and $q=p^{r}, r \geq 1$. Denote $\pi_{0}: N_{q} \rightarrow S^{2} M_{q}$ by $\pi_{0, q}$ and, in case $q \neq 2, i^{\prime}: S^{2} M_{q} \rightarrow N_{q}$ and $\pi^{\prime}: N_{q} \rightarrow S^{2}$ by $i_{q}^{\prime}$ and $\pi_{q}^{\prime}$ respectively. Choosing a sequence $\left\{\bar{\alpha}_{q}\right\}, \bar{\alpha}_{q} \in\left\{\bar{N}_{q}, M_{q} \wedge M_{q}\right\}$. of (4.17) we get
a sequence $\left\{\alpha_{q}\right\}, \alpha_{q}=\bar{\alpha}_{q} j \in\left\{N_{q}, M_{q} \wedge M_{q}\right\}$, of elements of (4.18).
Let $\tilde{h}$ be given with a commutative and associative multiplication $\mu$, and assume that $\eta^{* *}=0$ in $\widehat{h}$ when $p=2$. Put $\gamma_{0}=\gamma_{0, q}=\pi_{q}^{\prime *}\left(\sigma^{2} 1\right)$ in case $q \neq 2$ (cf., (5.4')), and $\gamma_{0}=\gamma_{0,2}=\pi_{1}^{*} \gamma_{1}$ in case $q=2$ after choosing $\gamma_{1} \in \widetilde{h}^{2}(P)$ such that $i_{P}^{*} \gamma_{1}=\sigma^{2} 1$ (cf., 9.1). Making use of $\alpha_{q}$ and $\gamma_{0, q}$ chosen above, we define an admissible multiplication $\mu_{q}$ for each $q$ by (5. $6^{\prime}$ ). $\mu_{q}$ is associative (or commutative and associative) under suitable conditions for $\widehat{h}$ (Theorems 9.9, 9.10, 10.6 and 10.7).
$\mu_{p}$ defines a multiplication in $\widetilde{E}_{1}^{*}\left(; Z_{p}\right)$. Since $d_{1}=\delta_{p}$ is a derivation by $\left(\Lambda_{2}\right)$, the term $\widetilde{E}_{2}^{*}\left(; Z_{p}\right)$ has a multiplication induced from $\mu_{p}$. Our next task is to prove that $\mu_{p}$ induces multiplications into successive terms $\widetilde{E}_{r}^{*}\left(; Z_{p}\right), r \geq 3$, so that $\left\{\widetilde{E}_{r}^{*}\left(; Z_{p}\right), r \geq 1\right\}$ becomes a functor of spectral sequences with a multiplicative structure.
11.4. Consider the following diagram (in the stable range) for $r \geq 2$ :

$$
\begin{gathered}
S^{2} M_{q} \xrightarrow{i_{q}^{\prime}} N_{q} \xrightarrow{\alpha_{q}} M_{q} \wedge M_{q} \xrightarrow{1 \wedge \pi_{q}} S^{2} M_{q} \\
\uparrow S^{2} \overline{\overline{1}} \\
\uparrow \overline{1} \wedge \overline{1} \\
S^{2} M_{p} \stackrel{\pi_{0, p}}{\longleftrightarrow} N_{p} \xrightarrow{\alpha_{p}} M_{p} \wedge M_{p} \xrightarrow{1 \wedge \pi_{p}} S^{2} \overline{\overline{1}} \\
S^{2} M_{p}
\end{gathered}
$$

By an easy calculation making use of (2.5) we see that the right square is commutative, i.e.,

$$
\begin{equation*}
\left(1 \wedge \pi_{q}\right)(\overline{1} \wedge \overline{1})=\left(S^{2} \overline{1}\right)\left(1 \wedge \pi_{p}\right) \tag{11.3}
\end{equation*}
$$

The left square is generally not commutative. Nevertheless,

$$
\begin{aligned}
& \left(1 \wedge \pi_{q}\right)_{*}\left\{\alpha_{q} i_{q}^{\prime}\left(S^{2} \overline{1}\right) \pi_{0, p}-(\overline{1} \wedge \overline{1}) \alpha_{p}\right\} \\
& \quad=\pi_{0, q} i_{q}^{\prime}\left(S^{2} \overline{1}\right) \pi_{0, p}-\left(S^{2} \overline{1}\right)\left(1 \wedge \pi_{p}\right) \alpha_{p} \quad \text { by }\left(4.18^{\prime}\right) \\
& \quad=\left(S^{2} \overline{1}\right) \pi_{0, p}-\left(S^{2} \overline{1}\right) \pi_{0, p}=0 \quad \text { by }\left(4.18^{\prime}\right) \text { and }(5.2),
\end{aligned}
$$

that is, there exists an element

$$
b_{q} \in\left\{N_{p}, S M_{q}\right\}
$$

such that

$$
\begin{equation*}
\left(1 \wedge i_{q}\right)_{*} b_{q}=\alpha_{q} i_{q}^{\prime}\left(S^{2} \overline{1}\right) \pi_{0, p}-(\overline{1} \wedge \overline{1}) \alpha_{p} \tag{11.4}
\end{equation*}
$$

We have

$$
\begin{aligned}
\rho_{q, p} \mu_{q} & =\rho_{q, p} \sigma^{-2}\left(\alpha_{q} i_{q}^{\prime}\right) * *\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu \\
& =\sigma^{-2}\left(\alpha_{q} i_{q}^{\prime}\left(S^{2} \overline{1}\right)\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu \\
& =\sigma^{-2} \gamma_{W}\left(\alpha_{q} i_{q}^{\prime}\left(S^{2} \overline{1}\right) \pi_{0, p}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu
\end{aligned}
$$

and

$$
\begin{aligned}
\mu_{p}\left(\rho_{q, p} \otimes \rho_{q, p}\right) & =\sigma^{-2} \gamma_{W} \alpha_{p}^{* *}\left(1 \wedge T_{p} \wedge 1\right)^{*} \mu\left(\overline{1}^{* *} \otimes \overline{1}^{* *}\right) \\
& =\sigma^{-2} \gamma_{W}\left((\overline{\mathbf{1}} \wedge \overline{1}) \alpha_{p}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu
\end{aligned}
$$

where $T_{q}=T\left(Y, M_{q}\right), W=X \wedge Y$ and $\gamma_{W}: \tilde{h}^{k}\left(W \wedge N_{p}\right) \rightarrow \tilde{h}^{k}\left(W \wedge S^{2} M_{p}\right)$. Thus by (11.4) we have

$$
\begin{equation*}
\rho_{q, p} \mu_{p}-\mu_{p}\left(\rho_{q, p} \otimes \rho_{q, p}\right)=\sigma^{-2} \gamma_{W}\left(\left(1 \wedge i_{q}\right) b_{q}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu \tag{11.5}
\end{equation*}
$$

11.5. Here we shall discuss the groups $\left\{N_{p}, S M_{q}\right\}$ for $r \geq 2$.

The case $p=2$. By a similar discussion as the proof of Theorem 4.1 we see that

$$
\begin{equation*}
\left\{S M_{2}, S M_{q}\right\} \cong Z_{2} \oplus Z_{2} \tag{11.6}
\end{equation*}
$$

with generators $S \overline{1}$ and $\left(S i_{q}\right) \eta\left(S \pi_{2}\right)$, and

$$
\begin{equation*}
\left\{S^{2} M_{2}, S M_{q}\right\} \cong Z_{4} \oplus Z_{2} \tag{11.7}
\end{equation*}
$$

with generators $\left(S i_{q}\right) \bar{\eta}$ (of order 4) and $(S \overline{1}) \tilde{\eta}\left(S^{2} \pi_{2}\right)$ (of order 2), where $\bar{\eta} \in\left\{S^{2} M_{2}, S^{2}\right\}$ and $\tilde{\eta} \in\left\{S^{4}, S M_{2}\right\}$.

Consider the following exact sequence (1.5) associated to the cofibration $S^{2} \rightarrow N_{2} \rightarrow S^{2} M_{2}$ :

$$
\begin{aligned}
& \left\{S^{3}, S M_{q}\right\} \xrightarrow{\left(\eta\left(S^{2} \pi\right)\right)^{*}}\left\{S^{2} M_{2}, S M_{q}\right\} \xrightarrow{\pi_{0}^{*}}\left\{N_{2}, S M_{q}\right\} \\
& \xrightarrow{i_{0}^{*}}\left\{S^{2}, S M_{q}\right\} \xrightarrow{(\eta(S \pi))^{*}}\left\{S M_{2}, S M_{q}\right\} .
\end{aligned}
$$

$\left\{S^{3}, S M_{q}\right\} \simeq Z_{2}$ generated by $\left(S i_{q}\right) \eta$ (by (4.2)), and

$$
\begin{aligned}
\left(\eta\left(S^{2} \pi_{2}\right)\right)^{*}\left(S i_{q}\right) \eta & =\left(S i_{q}\right) \eta^{2}\left(S^{2} \pi_{2}\right) \\
& =2 \cdot\left(S i_{q}\right) \bar{\eta} \quad \text { by }\left(4.2^{\prime}\right) ;
\end{aligned}
$$

thus by (11.7) we see

$$
\begin{equation*}
\pi_{0}^{*}\left\{S^{2} M_{2}, S M_{q}\right\} \cong Z_{2} \oplus Z_{2} \tag{11.8}
\end{equation*}
$$

with generators $\left(S i_{q}\right) \bar{\eta} \pi_{0,2}$ and $(S \overline{1}) \tilde{\eta}\left(S^{2} \pi_{2}\right) \pi_{0,2}$.
Next, $\left\{S^{2}, S M_{q}\right\} \cong Z_{q}$ generated by $S i_{q}((4.2))$ and $\left(\eta\left(S \pi_{2}\right)\right)^{*}\left(S i_{q}\right)=$ $\left(S i_{q}\right) \eta\left(S \pi_{2}\right)$ is non-zero and of order 2 by (11.6); hence

$$
\begin{equation*}
i_{0}^{*}\left\{N_{2}, S M_{q}\right\} \cong Z_{q / 2} \tag{11.9}
\end{equation*}
$$

generated by $2 \cdot S i_{q}$.
Lemma 11.6. $\left\{N_{2}, S M_{q}\right\} \cong Z_{2} \oplus Z_{q}$ with generators $\left(S i_{q}\right) \bar{\eta} \pi_{0,2}$ (of order 2) and (Si $\left.i_{q}\right) \bar{\xi}_{1}$ (of order $q$ ) for $q=2^{r}, r \geq 2$, where $\bar{\xi} \in\left\{P, S^{2}\right\}$ (cf., (8.3)).

Proof. First look at the group $\left\{P, S M_{2}\right\}$. We compute this group in two ways. Discussing an exact sequence (1.5') for $S^{1} \rightarrow M_{2} \rightarrow S^{2}$, we see by (8.2) that

$$
\left\{P, S M_{2}\right\} \cong Z_{2} \quad \text { with a generator }\left(S i_{2}\right) \xi
$$

On the other hand, discussing an exact sequence (1.5) for $S^{2} \rightarrow P \rightarrow S^{4}$ we see by (4.2)-(4.2') that

$$
\left\{P, S M_{2}\right\} \cong Z_{2} \quad \text { with generator } \quad \tilde{\eta} \pi_{P} .
$$

Thus we see that

$$
\tilde{\eta} \pi_{P}=\left(S i_{2}\right) \xi .
$$

Then

$$
\begin{array}{rlr}
(q / 2) \cdot\left(S i_{q}\right) \bar{\xi}_{1}=(S \overline{1})\left(S i_{2}\right) \xi_{1} & \text { by }(2.5) \\
\quad=(S \overline{1}) \tilde{\eta} \pi_{P} \pi_{1}=(S \overline{1}) \widetilde{\eta}\left(S^{2} \pi_{2}\right) \pi_{0,2} & \text { by (8.8). }
\end{array}
$$

And

$$
\begin{aligned}
i_{0}^{*}\left(\left(S i_{q}\right) \xi \pi_{1}\right) & =\left(S i_{q}\right) \xi i_{P} & & \text { by }(8.8) \\
& =2 \cdot S i_{q} & & \text { by }(8.3) .
\end{aligned}
$$

These, combined with (11.8) and (11.9), prove the lemma.
The case $p$ odd prime. Since $N_{p}=S^{2} \vee S^{2} M_{p}$, we have the direct sum decomposition

$$
\left\{N_{p}, S M_{q}\right\} \cong \pi_{p}^{\prime *}\left\{S^{2}, S M_{q}\right\} \oplus \pi_{0, p}^{*}\left\{S^{2} M_{p}, S M_{q}\right\}
$$

where $\pi_{n}^{\prime *}$ and $\pi_{0, p}^{*}$ are monomorphic. Here, $\left\{S^{2}, S M_{q}\right\} \cong Z_{q}$ generated by $S i_{q}((4.2))$, and $\left\{S^{2} M_{p}, S M_{q}\right\} \cong 0$ as is easily seen from an exact sequence (1.5). Thus we obtain
(11.10) $\left\{N_{p}, S M_{q}\right\} \cong Z_{q}$ generated by $\left(S i_{q}\right) \pi_{p}^{\prime}$ for $p$ an odd prime and $q=p^{r}, r \geq 2$.
11. 6. Now we shall discuss the deviation

$$
\rho_{q, p} \mu_{q}-\mu_{p}\left(\rho_{q, p} \otimes \rho_{q, p}\right), \quad q=p^{r} \text { and } r \geq 2
$$

The case $p=2$. First we prove
Lemma 11.7. There exists a relation

$$
\pi_{2} \wedge \bar{\xi}=\left(S^{2} \bar{\eta}\right)\left(1_{M} \wedge \pi_{P}\right)
$$

for $\bar{\xi} \in\left\{P, S^{2}\right\}$ and $\bar{\eta} \in\left\{S^{2} M_{2}, S^{2}\right\}$.
Proof. Discussing an exact sequence (1.5) for $M_{2} \wedge S^{2} \rightarrow M_{2} \wedge P \rightarrow M_{2} S^{4}$ by (4.2) and (4.2) we see that

$$
\left\{M_{2} \wedge P, S^{4}\right\} \cong Z_{2} \quad \text { generated by } \quad\left(S^{2} \bar{\eta}\right)\left(1_{M} \wedge \pi_{P}\right) .
$$

On the other hand, discussing an exact sequence (1.5) for $S^{1} \wedge P \rightarrow$ $M_{2} \wedge P \rightarrow S^{2} \wedge P$ by (8.2) we see that

$$
\left\{M_{2} \wedge P, S^{4}\right\} \cong Z_{2} \quad \text { generated by } \quad \pi_{2} \wedge \xi .
$$

Thus the lemma follows.
By Lemma 11.6 the element $b_{q} \in\left\{N_{2}, S M_{q}\right\}$ can be written as

$$
b_{q}=\varepsilon \cdot\left(S i_{q}\right) \bar{\eta} \pi_{0,2}+\varepsilon^{\prime} \cdot\left(S i_{q}\right) \xi \pi_{1}
$$

with $\varepsilon \in Z_{2}$ and $\varepsilon^{\prime} \in Z_{q}$. Then, by (11.5)

$$
\begin{aligned}
& \rho_{q, 2} \mu_{q}-\mu_{2}\left(\rho_{q, 2} \otimes \rho_{q, 2}\right) \\
& \left.=\varepsilon \varepsilon \cdot \sigma^{-2} \gamma_{W}\left(i_{q} \wedge i_{q}\right) \bar{\eta} \pi_{0,2}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu \\
& \quad \quad+\varepsilon^{\prime} \cdot \sigma^{-2} \gamma_{W}\left(\left(i_{q} \wedge i_{q}\right) \overline{2}_{\pi_{1}}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu .
\end{aligned}
$$

Here

$$
\begin{aligned}
& \sigma^{-2} \gamma_{W}\left(\left(i_{q} \wedge i_{q}\right) \bar{\eta}_{0,2}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu \\
& \quad=\sigma^{-2} \bar{\eta}^{* *}\left(1_{X} \wedge T_{1} \wedge 1_{S}\right)^{*} \mu\left(\sigma \delta_{q, 0} \otimes \sigma \delta_{q, 0}\right) \quad \text { by Lemma } 5.2 \text {, (i) } \\
& \quad=\sigma^{-2} \bar{\eta}^{* *} \sigma^{2} \mu\left(\delta_{q, 0} \otimes \delta_{q, 0}\right)
\end{aligned}
$$

where $T_{1}=T\left(Y, S^{1}\right)$ and $S=S^{1}$, and

$$
\begin{aligned}
\sigma^{-2} & \gamma_{W}\left(\left(i_{q} \wedge i_{q}\right) \xi \pi_{1}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu & & \\
& =\sigma^{-4} \tilde{\gamma}_{W \wedge M}\left(1_{W} \wedge p_{0}\right)^{*} \sigma^{2}\left(\xi_{1} \pi_{1}\right)^{* *} \sigma^{2} \mu\left(\delta_{q, 0} \otimes \delta_{q, 0}\right) & & \text { by Lemma } 9.2 \\
& =\sigma^{-4} \tilde{\gamma}_{W \wedge M}\left(\left(S^{2} \xi\right)\left(S^{2} \pi_{1}\right) p_{0}\right)^{* *} \sigma^{4} \mu\left(\delta_{q, 0} \otimes \delta_{q, 0}\right) & & \\
& =\sigma^{-4} \gamma_{W \wedge M}\left(\left(S^{2} \xi\right)\left(1_{P} \wedge \pi_{2}\right) T\right)^{* *} \sigma^{4} \mu\left(\delta_{q, 0} \otimes \delta_{q, 0}\right) & & \text { by }(8.10) \text { for } T=T\left(M_{2}, P\right) \\
& =\sigma^{-4} \gamma_{W \wedge M}\left(\pi_{2} \wedge \bar{\xi}\right)^{* *} \sigma^{4} \mu\left(\delta_{q, 0} \otimes \delta_{q, 0}\right) & & \text { since } T\left(S^{2}, S^{2}\right) \simeq 1 \\
& =\sigma^{-4} \gamma_{W \wedge M}\left(1_{M} \wedge \pi_{P}\right)^{* *}\left(S^{2} \bar{\eta}\right)^{* *} \sigma^{4} \mu\left(\delta_{q, 0} \otimes \delta_{q, 0}\right) & & \text { by Lemma } 11.7 \\
& =\sigma^{-2} \bar{\eta}^{* *} \sigma^{2} \mu\left(\delta_{q, 0} \otimes \delta_{q, 0}\right) & & \text { by Lemma } 9.1, \text { (i). }
\end{aligned}
$$

Therefore, for $x \in \widehat{h}^{i}\left(X ; Z_{q}\right)$ and $y \in \widehat{h}^{j}\left(Y ; Z_{q}\right)$,

$$
\begin{aligned}
& \rho_{q, 2} \mu_{q}(x \otimes y)-\mu_{2}\left(\rho_{q, 2} x \otimes \rho_{q, 2} y\right) \\
& \quad=\varepsilon_{r} \cdot \sigma^{-2} \bar{\eta}^{* *} \sigma^{2} \mu\left(\delta_{q, 0} x \otimes \delta_{q, 0} y\right) \\
& \quad=\varepsilon_{r} \cdot \mu\left(\mu\left(\delta_{q, 0} x \otimes \delta_{q, 0} y\right) \otimes \bar{\eta}^{*} 1\right) \\
& \quad=\varepsilon_{r} \cdot \mu_{L}\left(\mu\left(\delta_{q, 0} x \otimes \delta_{q, 0} y\right) \otimes a\right) \\
& \quad=\varepsilon_{r} \cdot \mu_{2}\left(\mu_{2}\left(\delta_{q, 2} x \otimes \delta_{q, 2} y\right) \otimes a\right),
\end{aligned}
$$

where $\varepsilon_{r}=\varepsilon+\left(\varepsilon^{\prime} \bmod 2\right) \in Z_{2}$ and $a$ is an element of $\widehat{h}^{-2}\left(S^{0} ; Z_{2}\right)$ such that $a=\bar{\eta}^{*} 1$ via the identification $\widehat{h}^{-2}\left(S^{0} ; Z_{2}\right)=\widetilde{h}^{0}\left(M_{2}\right)$. Since $\delta_{2,0} a=\sigma \eta^{*} 1=0$, there exists an element $a_{0} \in \widehat{h}^{-2}\left(S^{2}\right)$ such that $a=\rho_{2} a_{0}$. Thus we obtain

Proposition 11.8. Let $q=2^{r}, r \geq 2, x \in \widetilde{h}^{i}\left(X ; Z_{q}\right)$ and $y \in \widehat{h}^{j}\left(Y ; Z_{q}\right)$. There holds the relation

$$
\begin{aligned}
& \rho_{q, 2} \mu_{q}(x \otimes y)-\mu_{2}\left(\rho_{q, 2} x \otimes \rho_{q, 2} y\right) \\
& \quad=\varepsilon_{r} \cdot \mu_{2}\left(\mu_{2}\left(\delta_{q, 2} x \otimes \delta_{q, 2} y\right) \otimes \rho_{2} a_{0}\right)
\end{aligned}
$$

for an element $a_{0} \in \widetilde{h}^{-2}\left(S^{0}\right)$ (independent of $r$ ) and $\varepsilon_{r} \in Z_{2}$. If $\bar{\eta}^{* *}=0$ in $\widetilde{h}$, then the right hand side becomes zero.

The case $p$ odd prime. By (11.10) the element $b_{q} \in\left\{N_{p}, S M_{q}\right\}$ can be written as

$$
b_{q}=\varepsilon_{q} \cdot\left(S i_{q}\right) \pi_{p}^{\prime}
$$

with $\varepsilon_{q} \in Z_{q}$. Then, by (11.5)

$$
\begin{array}{ll}
\rho_{q, p} \mu_{q}-\mu_{p}\left(\rho_{q, p} \otimes \rho_{q, p}\right) \\
\quad=\varepsilon_{q} \cdot \sigma^{-2} \gamma_{W} \pi_{p}^{\prime *}\left(i_{q} \wedge i_{q}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu & \\
\quad=\varepsilon_{q} \cdot \sigma^{-2} i_{p}^{\prime * *} \pi_{p}^{\prime * *}\left(i_{q} \wedge i_{q}\right)^{* *}\left(1 \wedge T_{q} \wedge 1\right)^{*} \mu & \text { by }\left(5.4^{\prime}\right) \\
\quad=0 & \text { by }(5.2) .
\end{array}
$$

Thus we obtain
Proposition 11.9. Let $p$ be an odd prime and $q=p^{r}, r \geq 2$. There holds the relation

$$
\rho_{q, p}=\mu_{p}\left(\rho_{q, p} \otimes \rho_{q, p}\right) .
$$

11.7. $\mu_{p}$ gives a multiplication $m_{1}$ on $\widetilde{E}^{*}\left(\cdot Z_{p}\right)$ by putting $m_{1}=\mu_{p}$. Since $\delta_{p}$ is a derivation for $\mu_{p}, d_{1}$ is also so for $m_{1}$; hence $m_{1}$ induces a multiplication $m_{2}$ in $\widetilde{E}_{2}^{*}\left(; Z_{p}\right)$ passing to quotients. Assume that $m_{i}$, $2 \leq i \leq r$, is defined so that $m_{i}$ induces $m_{i+1}$ passing to quotient $1 \leq i \leq r-1$. Propositions 11.1, 11.8 and 11.9 show that

$$
\begin{align*}
& l_{r} \mu_{q}(x \otimes y)-m_{r}\left(l_{r} x \otimes l_{r} y\right) \\
& \quad= \begin{cases}0 & \text { if } \quad p \text { odd } \\
\varepsilon_{r} \cdot m_{r}\left(m_{r}\left(d_{r} l_{r} x \otimes d_{r} l_{r} y\right) \otimes q_{r} a_{0}\right) & \text { if } \quad q=2\end{cases} \tag{11.11}
\end{align*}
$$

for any $x \in \widehat{h}^{i}\left(X ; Z_{q}\right)$ and $y \in \widehat{h}^{j}\left(Y ; Z_{q}\right)$, where $q=p^{r}, \varepsilon_{r} \in Z_{2}$ and $a_{0}$ is an element of $\widetilde{h}^{-2}\left(S^{0}\right)$. The right hand side of (11.11) vanishes if $d_{r} l_{r} x=0$ or $d_{r} l_{r} y=0$; in particular

$$
\begin{aligned}
& m_{r}\left(m_{r}\left(d_{r} l_{r} x \otimes d_{r} l_{r} y\right) \otimes q_{r} a_{0}\right) \\
& \quad=m_{r}\left(m_{r}\left(l_{r} \delta_{q} x \otimes l_{r} \delta_{q} y\right) \otimes l_{r} \rho_{q} a_{0}\right) \quad \text { by Proposition 11.1 } \\
& \quad=l_{r} \mu_{q}\left(\mu_{q}\left(\delta_{q} x \otimes \delta_{q} y\right) \otimes \rho_{q} a_{0}\right) \\
& \quad=l_{r} \delta_{q} \mu_{q}\left(\mu_{q}\left(x \otimes \delta_{q} y\right) \otimes \rho_{q} a_{0}\right) \\
& \quad=d_{r} m_{r}\left(m_{r}\left(l_{r} x \otimes d_{r} l_{r} y\right) \otimes q_{r} a_{0}\right) .
\end{aligned}
$$

Hence

$$
\begin{aligned}
d_{r} m_{r}\left(l_{r} x \otimes l_{r} y\right) & =l_{r} \delta_{q} \mu_{q}(x \otimes y) \\
& =l_{r} \mu_{q}\left(\delta_{q} x \otimes y\right)+(-1)^{i} l_{r} \mu_{q}\left(x \otimes \delta_{q} y\right) \\
& =m_{r}\left(d_{r} l_{r} x \otimes l_{r} y\right)+(-1)^{i} m_{r}\left(l_{r} x \otimes d_{r} l_{r} y\right),
\end{aligned}
$$

where $\operatorname{deg} x=i$. Since $l_{r}$ is epimorphic by Proposition 11.2, (iii), the above formula shows that $d_{r}$ is a derivation for $m_{r}$. Therefore $m_{r}$ induces a multiplication $m_{r+1}$ in $\widetilde{E}_{r+1}^{*}\left(; Z_{p}\right)$ by passing to quotients. Thus, by an induction on $r, m_{r}$ is defined for all $r \geq 1$.

We saw also that $d_{r}$ is a derivation for $m_{r}$ and for all $r \geq 1$.
Next we shall discuss the commutativity of $m_{r}$ for $p=2$ and $r \geq 2$. Since $\mu_{q}$ is commutative for $r \geq 2$, by (11.11) we have

$$
\begin{aligned}
& m_{r}\left(l_{r} x \otimes l_{r} y\right)+\varepsilon_{r} \cdot m_{r}\left(m_{r}\left(d_{r} l_{r} x \otimes d_{r} l_{r} y\right) \otimes q_{r} a_{0}\right) \\
& \quad=l_{r} \mu_{q}(x \otimes y) \\
& \quad=l_{r} T^{*} \mu_{q}(y \otimes x)=T^{*} l_{r} \mu_{q}(y \otimes x) \\
& \quad=T^{*} m_{r}\left(l_{r} y \otimes l_{r} x\right)+\varepsilon_{r} \cdot m_{r}\left(T^{*} m_{r}\left(d_{r} l_{r} y \otimes d_{r} l_{r} x\right) \otimes q_{r} a_{0}\right),
\end{aligned}
$$

where $T=T(X, Y)$ and the naturalities of $l_{r}$ and $m_{r}$ are used. This formula shows first that the commutativity relation holds if $d_{r} l_{r} x=0$ or $d_{r} l_{r} y=0$; in particular

$$
T^{*} m_{r}\left(d_{r} l_{r} y \otimes d_{r} l_{r} x\right)=m_{r}\left(d_{r} l_{r} x \otimes d_{r} l_{r} y\right)
$$

Thus

$$
m_{r}\left(l_{r} x \otimes l_{r} y\right)=T * m_{r}\left(l_{r} y \otimes l_{r} x\right)
$$

for any $x \in \widehat{h}^{i}\left(X ; Z_{q}\right)$ and $y \in \widehat{h}^{j}\left(Y ; Z_{q}\right)$, i.e., $m_{r}$ is commutative for $p=2$ and $r \geq 2$ by Proposition 11.2, (iii).

Summarizing the above discussions we have
Theorem 11.10. Let $\tilde{h}$ be given with a commutative and associative multiplication $\mu$, and assume that $\eta^{* *}=0$ in $\tilde{h}$ in case $p=2$. For every prime $p$ a suitable admissible multiplication $\mu_{p}$ induces a multiplication

$$
m_{r}: \widetilde{E}_{r}^{i}\left(X ; Z_{p}\right) \otimes \widetilde{E}_{r}^{j}\left(Y ; Z_{p}\right) \rightarrow \widetilde{E}_{r}^{i+j}\left(X \wedge Y ; Z_{p}\right)
$$

(in the sense that it is defined for any $i, j, X$ and $Y$ such that i) linear, ii) natural and iii) has a bilateral unit $1 \in \widetilde{E}_{r}^{0}\left(S^{0} ; Z_{p}\right)$ ) for each $r \geq 1$. $m_{r}$ is compatible with $\mu$ in the sense that

$$
m_{r}\left(q_{r} \otimes q_{r}\right)=q_{r} \mu
$$

$d_{r}$ is a derivation for $m_{r}$ and $m_{r}$ induces $m_{r+1}$ by passing to quotients $\left(m_{1}=\mu_{p}\right) . \quad m_{r}$ is commutative for $r \geq 2$. (If $p$ is odd or if $\bar{\eta}^{* *}=0$ in $\tilde{h}$
then $m_{1}$ is also commutative.) If $p \neq 3$ or if $\left(\nu \pi_{3}\right)^{* *}=0$ in $\tilde{h}$ then $m_{r}$ is associative.
11. 8. Finally consider the case $h=K$. Since $\tilde{K}^{\#}$ (a sphere) is torsionfree, every Bockstein spectral sequence of a sphere for $\tilde{K}$ collapses by Theorem 11.5, i.e., denoting the $Z$-graded $r$-th term by $E_{r}^{\#}$ in this case, we have

$$
\begin{equation*}
\widetilde{E}_{r}^{\#}\left(S^{n} ; Z_{p}\right) \cong \widetilde{K}_{r}^{\#}\left(S^{n} ; Z_{p}\right) \quad \text { for } \quad 1 \leq r \leq \infty . \tag{11.12}
\end{equation*}
$$

In the present case, since $\eta^{* *}=\nu^{* *}=0$ in $\widetilde{K}, \widetilde{E}_{r}^{\sharp}\left(; Z_{p}\right)$ has an associative multiplication $m_{r}$ for every $p$ and $r \geq 1$ with properties described in Theorem 11.10. Through the isomorphism (11.12) we have a natural map

$$
\begin{equation*}
\beta_{p, r}: \widetilde{E}_{r}^{i}\left(X ; Z_{p}\right) \rightarrow \widetilde{E}_{r}^{i-2}\left(X ; Z_{p}\right), \quad 1 \leq r \leq \infty, \tag{11.13}
\end{equation*}
$$

defined by

$$
\beta_{p, r}=m_{r}\left(\otimes q_{r} \sigma^{-2} g\right)
$$

for any $i$ and $X$, where $g$ is the reduced Hopf bundle over $S^{2}$. Clearly
(11.14) $\quad \beta_{p, 1}=\beta_{p}$, the $\bmod p$ Bott isomorphism,
(11.15) $\quad d_{r} \beta_{p, r}=\beta_{p, r} d_{r}$ and $\beta_{p, r}$ induces $\beta_{p, r+1}$ by passing to quotients.

Since $\beta_{p}$ is an isomorphism ((6.2)), (11.14)-(11.15) imply
(11.16) $\quad \beta_{p, r}$ is an isomorphism for every $p$ and $r \geq 1$.

From (6.4) follows

$$
\begin{equation*}
m_{r}\left(\beta_{p, r} \otimes 1\right)=m_{r}\left(1 \otimes \beta_{p, r}\right)=\beta_{p, r} m_{r} \tag{11.17}
\end{equation*}
$$

Thus, identifying $\widetilde{E}_{r}^{i}\left(X ; Z_{p}\right)$ with $\widetilde{E}_{r}^{i-2}\left(X ; Z_{p}\right)$ by $\beta_{p, r}$, we obtain a functor of $Z_{2}$-graded spectral sequences

$$
\widetilde{E}_{r}^{*}\left(; Z_{p}\right)=\widetilde{E}_{r}^{0}\left(; Z_{p}\right) \oplus \widetilde{E}_{r}^{1}\left(; Z_{p}\right), \quad r \geq 1,
$$

for each prime $p$ with $\widetilde{E}_{1}^{*}\left(; Z_{p}\right)=\widetilde{K}^{*}\left(; Z_{p}\right)$ and with a multiplication $\left\{m_{r}^{*}\right\}$ induced by $\left\{m_{r}\right\}$, which coincides of course with the $\bmod p$ Bockstein spectral sequence for $\tilde{K}^{*}$. Since $d_{r}$ is a derivation for $m_{r}^{*}, m_{r+1}^{*}$ is induced by $m_{r}^{*}$ and $m_{1}^{*}=\mu_{p}^{*}$, the Künneth isomorphism (Theorem 6.2) implies inductively

Theorem 11.11. In case $h=K, m_{r}^{*}$ induces an isomorphism

$$
\widetilde{E}_{r}^{*}\left(X ; Z_{p}\right) \otimes \widetilde{E}_{r}^{*}\left(Y ; Z_{p}\right) \cong \widetilde{E}_{r}^{*}\left(X \wedge Y ; Z_{p}\right)
$$

for any $X$ and $Y, 1 \leq r \leq \infty$, and for each prime $p$.

## 12. Appendix.

12.1. We consider here some properties of the maps $\bar{a}$ of (2.5).

Lemma 12.1. Let a be any integer. The element $\bar{a} \in\left\{M_{2}, M_{2}\right\}$ satisfies the relation

$$
\bar{a}=a^{2} \cdot 1_{M}= \begin{cases}1_{M} & \text { if } a \text { is odd } \\ 0 & \text { if } a \text { is even }\end{cases}
$$

Proof. Let $P^{n}$ be real projective $n$-spaces and $i: M_{2}=P^{2} \subset P^{3}$ the inclusion. Then, for $\bar{a}: M_{2} \rightarrow M_{2}$

$$
\{i \bar{a}\} \in\left[M_{2}, P^{3}\right] \cong\left[M_{2}, P^{\infty}\right] \cong H^{1}\left(M_{2} ; Z_{2}\right) \cong Z_{2}
$$

Thus

$$
i \bar{a} \simeq i \bar{b} \text { if and only if } a \equiv b(\bmod 2)
$$

The homomorphism

$$
\left\{M_{2}, M_{2}\right\} \rightarrow \operatorname{Hom}\left(\widetilde{K O}\left(M_{2}\right), \widetilde{K O}\left(M_{2}\right)\right)
$$

defined by the assignment $\alpha \rightarrow \alpha^{*}$ is an isomorphism, and the map $i^{*}: \widetilde{K O}\left(P^{3}\right) \rightarrow \widetilde{K O}\left(M_{2}\right)$ is also an isomorphism [1]. Hence $a \equiv b(\bmod 2)$ implies that $(i \bar{a})^{*}=(i \bar{b})^{*}$, whence $\bar{a}^{*}=\bar{b}^{*}$, whence $\bar{a}=\bar{b}$. Here, taking $b=0$ or 1 we obtain the lemma.

Theorem 12.2. Let $a$ be any integer. The element $\bar{a} \in\left\{M_{q}, M_{q}\right\}$ satisfies the relation

$$
\bar{a}= \begin{cases}a \cdot 1_{M} & \text { if } q \neq 2(\bmod 4) \\ a \cdot 1_{M}+(a(a-1) / 2) \cdot i_{q} \eta \pi_{q} & \text { if } q \equiv 2(\bmod 4) .\end{cases}
$$

Proof. By an exact sequence (1.5) for $S^{1} \rightarrow M_{q} \rightarrow S^{2}$ we see easily that

$$
\bar{a}=a \cdot 1_{M}+x \cdot i_{q} \eta \pi_{q}
$$

for $x \in Z_{2}$, where $x=0$ in case $q$ odd. In case $q$ even, for $\overline{q / 2}: M_{q} \rightarrow M_{2}$,

$$
\begin{aligned}
(\overline{q / 2}) \bar{a} & =a \cdot(\overline{q / 2})+x \cdot(\overline{q / 2}) i_{q} \eta \pi_{q} \\
& =a \cdot(\overline{q / 2})+x \cdot i_{2} \eta \pi_{q} .
\end{aligned}
$$

On the other hand

$$
(\overline{q / 2}) \bar{a}=\bar{a}(\overline{q / 2})=a^{2} \cdot(\overline{q / 2})
$$

by Lemma 12.1. Thus

$$
x \cdot i_{2} \pi_{q}=a(a-1) \cdot(\overline{q / 2}) .
$$

Here

$$
2 \cdot(\overline{q / 2})=\left\{\begin{array}{lll}
0 & \text { if } & q \equiv 0(\bmod 4) \\
i_{2} \eta \pi_{q} & \text { if } & q \equiv 2(\bmod 4)
\end{array}\right.
$$

by (4.13'). Therefore

$$
x=\left\{\begin{array}{lll}
0 & \text { if } & q \equiv 0(\bmod 4) \\
a(a-1) / 2(\bmod 2) & \text { if } & q \equiv 2(\bmod 4) .
\end{array} \quad\right. \text { q.e.d. }
$$

12.2. From the above theorem we obtain the following corollaries.

Corollary 12.3. If $q \neq 2(\bmod 4)$ or if $\eta^{* *}=0$ in $\tilde{h}$, then

$$
r_{*}(x)=r \cdot x
$$

for any integer $r$ and $r_{*}: \widetilde{h}^{*}\left(X ; Z_{q}\right) \rightarrow \tilde{h}^{*}\left(X ; Z_{q}\right)$.
Corollary 12.4. Let $d=(q, r)$ and $\left\{M_{q}, M_{r}\right\} \ni \overline{q / d}$ (a generator). For $\overline{a(q / d)} \in\left\{M_{q}, M_{r}\right\}$, we have

$$
\overline{a(q / d)}= \begin{cases}a \cdot \overline{q / d} & \text { if } q \equiv 2 \text { or if } r \equiv 2(\bmod 4) \\ a \cdot \overline{q / d}+(a(a-1) / 2) \cdot i_{r} \eta \pi_{q} & \text { if } q \equiv r \equiv 2(\bmod 4) .\end{cases}
$$

Corollary 12.5. For $\bar{a}, \bar{b}$ and $\overline{a+b}$ of $\left\{M_{q}, M_{r}\right\}$,

$$
\overline{a+b}= \begin{cases}\bar{a}+\bar{b} & \text { if } q \equiv 2 \text { or if } r \equiv 2(\bmod 4) \\ \bar{a}+\bar{b}+a b \cdot i_{r} \eta \pi_{q} & \text { if } q \equiv r \equiv 2(\bmod 4)\end{cases}
$$

Corollary 12.6. Propositions 2.4 and 2.5 hold under the assumption that $q \equiv 2$ or $r \equiv 2(\bmod 4)$ or $\eta^{* *}=0$ in $\widehat{h}$.

Corollary 12.7. The terms $\widetilde{E}_{r}^{*}, r \geq 2$, of $\bmod 2$ Bockstein spectral sequences are $Z_{2}$-modules. (If $p$ is odd or if $\eta^{* *}=0$ in $\widetilde{h}$, then $\widetilde{E}_{r}^{*}\left(; Z_{p}\right)$ for $\tilde{h}$ are $Z_{p}$-modules for $r \geq 1$.)

Because: for $r \geq 2$,

$$
\begin{aligned}
l_{r}^{-1}(0) & \supset 2_{*} \widetilde{h}^{i}\left(X ; Z_{2^{r-1}}\right) \\
& \supset 2_{*} \rho_{2^{r}, 2^{r-1}} \widetilde{h}^{i}\left(X ; Z_{2^{r}}\right)=2 \cdot \widetilde{h}^{i}\left(X ; Z_{2^{r}}\right),
\end{aligned}
$$

whence Proposition 11.2, (iii), proves Corollary 12.7.
