

A NOTE ON WEAK SEQUENTIAL CONVERGENCE

R. D. MCWILLIAMS

1. Let X be a real Banach space, J_x the canonical mapping from X into X^{**} , and $K(X)$ the set of all elements F in X^{**} which are X^* -limits of sequences in $J_x X$. Thus $F \in K(X)$ if and only if there exists a sequence $\{x_n\}$ in X such that

$$(1.1) \quad F(f) = \lim_n f(x_n)$$

for all $f \in X^*$. While the closure of $J_x X$ in the X^* -topology is X^{**} [4, p. 229], it is not true in general that $K(X) = X^{**}$. By using properties of the space of continuous real functions defined on a real interval, we shall prove that the subspace $K(X)$ is norm-closed in X^{**} .

2. If x is a bounded real function defined on a closed interval $[a, b]$, let $\|x\| = \sup \{ |x(s)| : a \leq s \leq b \}$. If x is a bounded Baire function of the first class, then there exists a sequence $\{x_n\} \subset \mathcal{C}[a, b]$ such that $x(s) = \lim_n x_n(s)$ for all $s \in [a, b]$ and $\|x_n\| = \|x\|$ for all n [2, p. 138]. However, if a bounded function x is the pointwise limit of an unbounded sequence of elements of a subspace X of \mathcal{C} , then it is not necessarily true that x is the pointwise limit of a bounded sequence in X .

LEMMA 1. *Let X be a subspace of \mathcal{C} , and let x be a real function which is the pointwise limit of a bounded sequence in X . Then there exists a sequence $\{x_n\}$ in X such that x is the pointwise limit of $\{x_n\}$ and $\|x_n\| = \|x\|$ for all n .*

Proof. If $\{y_n\}$ is a sequence in X which converges pointwise to x , with $\sup_n \|y_n\| = M < \infty$, let continuous functions $\varphi, \varphi_1, \varphi_2, \dots$ be defined by

$$(2.1) \quad \begin{cases} \varphi(s) \equiv \|x\| \\ \varphi_n(s) = \max(y_n(s), \|x\|) \end{cases}$$

for all $s \in [a, b]$. Then $\{\varphi_n\}$ converges to φ in the \mathcal{C}^* -topology of \mathcal{C} [1, p. 224], and hence [3, p. 36] for each positive integer n there exist nonnegative numbers a_{n1}, \dots, a_{nk_n} such that

$$(2.2) \quad \sum_{k=1}^{k_n} a_{nk} = 1, \quad \left| \sum_{k=1}^{k_n} a_{nk} \varphi_{n+k} - \varphi \right| < n^{-1}.$$

Define $\{z_n\} \subset X$ by

$$(2.3) \quad z_n = \sum_{k=1}^{k_n} a_{nk} y_{n+k}.$$

Then $\{z_n\}$ converges pointwise to x , and $-M \leq z_n(s) \leq \|x\| + n^{-1}$ for each n .

If a sequence $\{\psi_n\}$ is now defined in \mathcal{E} by $\psi_n = \min(z_n, -\varphi)$, an argument like that used with $\{\varphi_n\}$ shows that there exist, for each n , nonnegative numbers b_{n1}, \dots, b_{nj_n} such that

$$(2.4) \quad \sum_{j=1}^{j_n} b_{nj} = 1, \quad \left| \sum_{j=1}^{j_n} b_{nj} \psi_{n+j} + \varphi \right| < n^{-1}.$$

If $\{u_n\} \subset X$ is defined by

$$(2.5) \quad u_n = \sum_{j=1}^{j_n} b_{nj} z_{n+j},$$

then x is the pointwise limit of $\{u_n\}$, and $\|u_n\| \rightarrow \|x\|$ as $n \rightarrow \infty$. Since it may be assumed that $\|u_n\| \neq 0$ for each n , the desired sequence $\{x_n\}$ is obtained by defining $x_n = (\|x\|/\|u_n\|) u_n$.

3. The conjugate space \mathcal{E}^* of \mathcal{E} is equivalent with the space of all finite regular signed Borel measures on $[a, b]$, under a mapping U such that if $f \in \mathcal{E}^*$ and $\mu_f = Uf$, then

$$(3.1) \quad f(x) = \int_a^b x d\mu_f$$

for all $x \in \mathcal{E}$ [4, p. 397]. It follows that if X is a closed subspace of \mathcal{E} and $F \in X^{**}$, then $F \in K(X)$ if and only if there exists a bounded, pointwise-convergent sequence $\{y_n\}$ in X with the property that

$$(3.2) \quad F(f|X) = \int_a^b (\lim y_n) d\mu_f$$

for all $f \in \mathcal{E}^*$.

LEMMA 2. *If X is a real Banach space and $F \in K(X)$, then there exists a sequence $\{x_n\}$ in X such that F is the X^* -limit of $\{J_x x_n\}$ and $\|x_n\| = \|F\|$ for all n .*

Proof. *Case 1.* If X is a closed subspace of \mathcal{E} and $F \in K(X)$, there must be a bounded, pointwise-convergent sequence $\{y_n\} \subset X$ such that (3.2) holds for all $f \in \mathcal{E}^*$. If $x(s) = \lim_n y_n(s)$ for $a \leq s \leq b$, then by Lemma 1 there exists a sequence $\{x_n\}$ in X such that x is the pointwise limit of $\{x_n\}$ and $\|x_n\| = \|x\|$ for all n . Thus F is the X^* -limit of $\{J_x x_n\}$ and it is easily verified that $\|F\| = \|x_n\|$ for each n .

Case 2. If X is an arbitrary real Banach space and $F \in K(X)$, then there is a sequence $\{y_n\}$ in X such that F is the X^* -limit of $\{J_x y_n\}$. If Y is the closed subspace of X generated by $\{y_n\}$, we can define

$G \in Y^{**}$ by

$$(3.3) \quad G(f|Y) = F(f) \text{ for all } f \in X^*,$$

and this definition is unambiguous since F is the X^* -limit of a sequence in $J_X Y$. It is easy to verify that $G \in K(Y)$ and $\|G\| = \|F\|$. Since Y is separable, Y is equivalent with a closed subspace of \mathcal{C} [1, p. 185], and hence by Case 1, there is a sequence $\{x_n\}$ in Y such that G is the Y^* -limit of $\{J_Y x_n\}$ and $\|x_n\| = \|G\| = \|F\|$ for all n . Finally, if $f \in X^*$, then

$$(3.4) \quad F(f) = G(f|Y) = \lim_n f(x_n),$$

so F is the X^* -limit of $\{J_X x_n\}$, and the lemma is proved.

4. THEOREM. *If X is a real Banach space, then $K(X)$ is norm-closed in X^{**} .*

Proof. If $F \in \overline{K(X)}$, then there is a sequence $\{F_n\}$ in $K(X)$ such that $F_n \rightarrow F$ in norm, and $\|F_n - F_{n-1}\| < 2^{-n}$ for each $n > 1$. If we let $F_0 = 0$, then by Lemma 2 there exists, for each $n \geq 1$, a sequence $\{x_{nk}\}$ in X such that $\|x_{nk}\| = \|F_n - F_{n-1}\|$ for all k and such that $F_n - F_{n-1}$ is the X^* -limit of $\{J_X x_{nk}\}$.

For each k the series $\sum_{n=1}^{\infty} x_{nk}$ converges to an element $x_k \in X$ such that

$$\left\| x_k - \sum_{n=1}^j x_{nk} \right\| < 2^{-j} \text{ for each } j.$$

Given $0 \neq f \in X^*$ and $\varepsilon > 0$, there exist positive integers J and K such that $2^{-J} < \varepsilon/(3\|f\|)$ and $|F_J(f) - f(\sum_{n=1}^J x_{nk})| < \varepsilon/3$ for all $k \geq K$. Hence for $k \geq K$,

$$(4.1) \quad |F(f) - f(x_k)| \leq |(F - F_J)(f)| + \left| F_J(f) - f\left(\sum_{n=1}^J x_{nk}\right) \right| \\ + \left| f\left(\sum_{n=1}^J x_{nk}\right) - f(x_k) \right| < \varepsilon,$$

so that F is the X^* -limit of $\{J_X x_k\}$.
