ON A GENERALIZATION OF THE WILSON-GLAISHER THEOREM

BY GIOVANNI RICCI

1. *Introduction.* J. W. L. Glaisher* has shown that, if n be any number, p any odd prime not exceeding n, k the integral part of the quotient n/p, and if A_r denote the sum of the products of the first $n-1$ consecutive integers taken r together, then

$$A_{p-1} + k \equiv 0 \pmod{p}.$$

This theorem contains Wilson's theorem as the special case $n=p$, and it has been extended by R. E. Moritz† in the following form. If $n=kp+q$, p an odd prime, $0\leqq q<p$, and if ${}^mA_r$ denote the sum of the products of any $n-1$ consecutive numbers, $m+1$, $m+2$, $\cdots$, $m+n-1$ taken r together; if $0<q<p$, then ${}^mA_{p-1}+k\equiv 0$, (mod p). If $q=0$, then ${}^mA_{p-1}+k\equiv 0$, or $\equiv 1$, (mod p), according as m is, or is not, a multiple of p.

It is the purpose of the present paper to show that the Wilson-Glaisher theorem, the Moritz theorem, and other theorems are special cases of a still more general theorem relating to the symmetric functions of special systems of numbers, these systems being composed of the residues of powers, eventually repeated, for different moduli.

2. *The Generalized Theorem.* We shall prove the following general theorem.

Let $m=p^\alpha q^\beta \cdots r^\gamma$, ($p, q, \cdots, r$ odd primes, $p<q<\cdots<r$; $\alpha\geqq 1, \beta\geqq 1, \cdots, \gamma\geqq 1$), be an odd number and let $\rho, \sigma, \cdots, \chi$ be any divisors respectively of $\phi(p^\alpha)$, $\phi(q^\beta)$, $\cdots$, $\phi(r^\gamma)$, where $\phi(n)$ denotes Euler's Indicator; we shall write $\rho=p^a\lambda$ (λ divisor

of $p-1$), $\sigma=q^b\mu$ (μ divisor of $q-1$), $\cdots$, $\chi=r^c\nu$ (ν divisor of $r-1$). Let $(u_0, u_1, \cdots, u_{\rho-1}), (v_0, v_1, \cdots, v_{\rho-1}), \cdots, (w_0, w_1, \cdots, w_{\chi-1})$ be the complete root systems respectively of the congruences

$$u^\rho \equiv 1 \pmod{p^\alpha}; \quad v^\sigma \equiv 1 \pmod{q^\beta}; \quad \cdots; \quad w^\chi \equiv 1 \pmod{r^\gamma}.$$

Consider the $\tau=\rho\sigma\cdots\chi$ numbers

$$t_1, t_2, \cdots, t_\tau$$

two by two incongruent (mod m), represented by the form

$$Au_d + Bv_e + \cdots + Cw_f,$$

$$(0 \leqq d \leqq \rho-1, 0 \leqq e \leqq \sigma-1, \cdots, 0 \leqq f \leqq \chi-1),$$

in which $A, B, \cdots, C$ denote auxiliary integers satisfying the congruences

$$A \equiv 1 \pmod{p^\alpha}; \qquad B \equiv 1 \pmod{q^\beta}; \qquad \cdots; \qquad C \equiv 1 \pmod{r^\gamma};$$

$$A \equiv 0 \left(\bmod \frac{m}{p^\alpha}\right); \quad B \equiv 0 \left(\bmod \frac{m}{q^\beta}\right); \quad \cdots; \quad C \equiv 0 \left(\bmod \frac{m}{r^\gamma}\right).$$

Consider the $k\tau$ integers $t_{j,i}$, ($j=1, 2, \cdots, \tau$; $i=1, 2, \cdots, k$), k by k congruent (mod m), precisely,

$$(1) \qquad t_{j,i} \equiv t_j \pmod{m}, \quad (i = 1, 2, \cdots, k), \quad j = 1, 2, \cdots, \tau,$$

and h other *arbitrary* integers

$$(2) \qquad z_1, z_2, \cdots, z_h, \qquad (h \geqq 0).$$

If $R_{s\tau}(m; \rho, \sigma, \cdots, \chi \| k, h)$ *denotes the sum of the products of integers* (1) *and* (2) *taken* $s\tau$ *together*, ($R_0=1$), *then from any one of the inequalities*

$$h < \lambda, \; h < \mu, \cdots, h < \nu$$

there follows the corresponding congruence

$$\text{(A)}\quad R_{s\tau}(m;\,\rho,\,\sigma,\,\cdots,\,\chi\|k,\,h)\begin{cases}\equiv(-1)^{s\tau(\lambda-1)/\lambda}\begin{pmatrix}\dfrac{k\tau}{\lambda}\\[2ex]\dfrac{s\tau}{\lambda}\end{pmatrix}\pmod{p^\alpha},\\[4ex]\equiv(-1)^{s\tau(\mu-1)/\mu}\begin{pmatrix}\dfrac{k\tau}{\mu}\\[2ex]\dfrac{s\tau}{\mu}\end{pmatrix}\pmod{q^\beta},\\[4ex]\cdots\cdots\cdots\cdots\cdots\cdots\\[2ex]\equiv(-1)^{s\tau(\nu-1)/\nu}\begin{pmatrix}\dfrac{k\tau}{\nu}\\[2ex]\dfrac{s\tau}{\nu}\end{pmatrix}\pmod{r^\gamma}.\end{cases}$$

In the special case $s=k$, $h<\lambda$, $h<\mu$, $\cdots$, $h<\nu$, if the integers

$$\frac{k\tau}{\lambda}(\lambda-1),\quad\frac{k\tau}{\mu}(\mu-1),\cdots,\frac{k\tau}{\nu}(\nu-1)$$

are all even or all odd, we have the congruence

$$R_{k\tau}(m;\,\rho,\,\sigma,\,\cdots,\,\chi\|k,\,h)\equiv\pm1\pmod{m}.$$

3. *Special Cases.* We observe that the $\phi(m)$ integers (mod m), prime to m, are characterized by their satisfying the congruences

$$t^{\phi(p^\alpha)}\equiv1\pmod{p^\alpha};\quad t^{\phi(q^\beta)}\equiv1\pmod{q^\beta};\quad\cdots;\quad t^{\phi(r^\gamma)}\equiv1\pmod{r^\gamma}.$$

Therefore we may express Wilson's classic theorem and its generalizations by means of the forms

$$R_{p-1}(p;p-1\|1,0)\equiv-1\pmod{p}\quad(\text{Wilson})^*,$$

$$\left.\begin{aligned}&R_{\phi(p^\alpha)}(p^\alpha;\phi(p^\alpha)\|1,0)\equiv-1\pmod{p^\alpha}\\&R_{\phi(m)}(m;\phi(p^\alpha),\phi(q^\beta),\cdots,\phi(r^\gamma)\|1,0)\equiv1\pmod{m}\end{aligned}\right\}\;(\text{Gauss})\dagger,$$

$$R_{p-1}(p;\,p-1\|k,\,h)\equiv-k\pmod{p}\quad\text{Glaisher–Moritz}\ddagger,$$

$$
\left.\begin{array}{c} R_{s\tau}(m;\phi(p^\alpha),\phi(q^\beta),\cdots,\phi(r^\gamma)\|k,0) \\ (\tau=\phi(m)=\phi(p^\alpha)\cdots\phi(r^\gamma)) \\ (\text{M. Bauer})^* \end{array}\right|
\begin{cases}
\equiv(-1)^{s\tau/(p-1)}\begin{pmatrix}\dfrac{k\tau}{p-1}\\ \dfrac{s\tau}{p-1}\end{pmatrix}\pmod{p^\alpha},\\
\equiv(-1)^{s\tau/(q-1)}\begin{pmatrix}\dfrac{k\tau}{q-1}\\ \dfrac{s\tau}{q-1}\end{pmatrix}\pmod{q^\beta},\\
\cdots\cdots\cdots\cdots\cdots\\
\equiv(-1)^{s\tau/(r-1)}\begin{pmatrix}\dfrac{k\tau}{r-1}\\ \dfrac{s\tau}{r-1}\end{pmatrix}\pmod{r^\gamma}.
\end{cases}
$$

For the ω-ic residues (mod p^α),

$$R_\rho(p^\alpha;\rho\|1,0)\equiv(-1)^{\rho-1}\pmod{p^\alpha};\qquad \rho=\frac{\phi(p^\alpha)}{D(\omega,\phi(p^\alpha))}\dagger\cdot$$

And also

$$(3)\quad R_{s\lambda}(m;\rho,\sigma,\cdots,\chi\|1,0)\equiv(-1)^{s(\lambda-1)}\begin{pmatrix}\dfrac{\tau}{\lambda}\\ s\end{pmatrix},\pmod{p^\alpha},\quad (\text{Ricci}).\ddagger$$

4. Proof. Let $R_{n_i}(m;\rho,\sigma,\cdots,\chi\|1,0)$ denote the sum of the products of the τ numbers $t_{j,i}$, $(j=1,2,\cdots,\tau)$, of the system (1) taken n_i together, and let R_n' be the sum of the products of the h numbers $z_1,z_2,\cdots,z_h$ taken n together ($R_n'=1$, if $hn=0$). Obviously we have the equality

$$(4)\quad R_{s\tau}(m;\rho,\sigma,\cdots,\chi\|k,h)$$
$$=\sum\left\{\prod_{i=1}^{k}R_{n_i}(m;\rho,\sigma,\cdots,\chi\|1,0)\right\}R_n',$$

in which the sum is extended to the solutions in integers $\geqq 0$ of the equation

$$n_1 + n_2 + \cdots + n_k + n = s\tau,$$

$$(0 \leqq n_i \leqq \tau,\ i = 1, 2, \cdots, k;\ 0 \leqq n \leqq h).$$

If $n_i \not\equiv 0 \pmod{\lambda}$, then it is known* that

$$R_{n_i}(m; \rho, \sigma, \cdots, \chi \| 1, 0) \equiv 0 \pmod{p^\alpha},$$

and if $n_i = s\lambda$, then the congruence (3) stands. Therefore if one at least of the integers $n_1, n_2, \cdots, n_k$ is $\not\equiv 0 \pmod{\lambda}$, then the corresponding term on the right of (4) is divisible by p^α; hence, for the relation $0 \leqq n \leqq h < \lambda$, we obtain

$$R_{s\tau}(m; \rho, \sigma, \cdots, \chi \| k, h)$$

$$\equiv \sum \prod_{i=1}^{k} R_{s_i\lambda}(m; \rho, \sigma, \cdots, \chi \| 1, 0) \pmod{p^\alpha},$$

$$\left(s_1 + s_2 + \cdots + s_k = s\frac{\tau}{\lambda};\ 0 \leqq s_i \leqq \frac{\tau}{\lambda}\right).$$

Then, by (3), we may write

$$R_{s\tau}(m; \rho, \sigma, \cdots, \chi \| k, h) \equiv (-1)^{s\tau(\lambda-1)/\lambda} \sum \prod_{i=1}^{k} \binom{\frac{\tau}{\lambda}}{s_i} \pmod{p^\alpha},$$

$$\left(s_1 + s_2 + \cdots + s_k = \frac{s\tau}{\lambda}\right);$$

and, by a well known formula on binomial coefficients, from this congruence we deduce the first formula of (A). We may deduce the other formulas in a similar manner.
